**Toshkent  
“Universitet”  
2007**

Ushbu kitob universitetlar hamda pedagogika institutlari, shuningdek, oliy texnika o'quv yurilarining oliy matematika predmeti chuqur dastur asosida o'qitiladigan fakultetlari talabalari uchun muljallangan. Uni yozishda mualliflar bii necha yillar davomida o'qigan ma'ruzalaridan foydalanganlar.

Kitob analiz kursining 2-qismi bo'lib, unda ko'p o'zgaruvchili funksiyalarning differentsiyal va integral hisobi, funksional qatorlar nazariyasi va Fur'e qatorlari batafsil bayon etilgan.

## 12-BOB

### Ko'p o'zgaruvchili funksiyalar, ularning limiti, uzluksizligi

«Matematik analiz asoslari» kursining 1-qismida bir o'zgaruvchili funksiyalar hafatsil o'rnatildi.

Matematika, fizika, texnika va fanning hoshqa tarmoqlarida shunday funksiyalar uchraydiki, ular ko'p o'zgaruvchilarga bog'liq bo'ladi. Masalan, doiraviy silindrning hajmi

$$V = \pi r^2 h \quad (12.1)$$

ham ikki o'zgaruvchi:  $r$ -radius hamda  $h$ -balandlikka bog'liq.

To'k kuchi

$$J = \frac{E}{R} \quad (12.2)$$

ham ikki o'zgaruvchi:  $E$ -elektr yurituvchi kuch va  $R$ -qarshilikning funksiyasi bo'ladi. Bunda silindrning hajmi (12.1) formula yordamida bir-biriga bog'liq bo'lмаган  $r$  va  $h$  o'zgaruvchilarning qiymatlariga ko'ra, to'k kuchi (12.2) formula yordamida bir-biriga bog'liq bo'lмаган  $E$  va  $R$  o'zgaruvchilarning qiymatlariga ko'ra topiladi. Shunga o'xshash misollarni juda ko'plab keltirish mumkin. Binobarin, ko'p o'zgaruvchili funksiyalami yuqoridaqidek chuqurroq o'rganish vazifasi tug'ildi.

Ko'p o'zgaruvchili funksiyalar nazariyasida ham bir o'zgaruvchili funksiyalar nazariyasidagidek, funksiya va uning limiti, funksiyaning uzluksizligi va xakazo kabi tushunchalar o'rganiladi. Bunda bir o'zgaruvchili funksiyalar haqidagi ma'lumotlardan muttasil foydalana horiladi.

Ma'lumki, bir o'zgaruvchili funksiyalarni o'rganishni ularning aniqlanish to'plamlarini (sohalarini) o'rganishdan boshlagan edik. Ko'p o'zgaruvchili funksiyalarni o'rganishni ham ularning aniqlanish to'plamlarini (sohalarini) bayon etishdan boshlaymiz.

#### I-§. $R^m$ fazo va uning muhim to'plamlari

1<sup>o</sup>.  $R^m$  fazo. m ta  $A_1, A_2, \dots, A_m$  ( $m > 1$ , butun son) to'plamlarning Dekart ko'paytmasi ikkita  $A$  va  $V$  to'plamlarning Dekart ko'paytmasiga o'xshash ta'tiflanadi. Agar  $A_1 = A_2 = \dots = A_m = R$  bo'lsa, u holda

$A_1 \times A_2 \times \dots \times A_m = R \times R \times \dots \times R = \{(x_1, x_2, \dots, x_m) : x_1 \in R, x_2 \in R, \dots, x_m \in R\}$   
bo'ladi. Ushbu

$$\{(x_1, x_2, \dots, x_m) : x_1 \in R, x_2 \in R, \dots, x_m \in R\}$$

to'plam  $R^m$  to'plam deb ataladi.  $R^m$  to'plamning elementi  $(x_1, x_2, \dots, x_m)$  shu to'plam nuqtasi deyiladi va u odatda bitta harf bilan belgilanadi:  $x = (x_1, x_2, \dots, x_m)$ . Bunda  $x_1, x_2, \dots, x_m$  sonlar x nuqtanining mos ravishda birinchisi, ikkinchi, ...  $m$ -koordinatalari deyiladi.

Agar  $x = (x_1, x_2, \dots, x_m) \in R^m$ ,  $y = (y_1, y_2, \dots, y_m) \in R^m$  nuqtalar uchun  $x_1 = y_1, x_2 = y_2, \dots, x_m = y_m$  bo'lsa, u holda  $x = y$  deb ataladi.

$R^n$  to'plamda ixtiyoriy  $x = (x_1, x_2, \dots, x_n)$ ,  $y = (y_1, y_2, \dots, y_n)$  nuqtalarni olaylik.

**I-ta'rif.** Ushbu

$$\rho(x, y) = \sqrt{(y_1 - x_1)^2 + (y_2 - x_2)^2 + \dots + (y_n - x_n)^2} = \sqrt{\sum_{i=1}^n (y_i - x_i)^2} \quad (12.3)$$

miqdor  $x$  va  $y$  nuqtalar orasidagi masofa (Evklid masofasi) deb ataladi. Bunday aniqlangan masofa quyidagi xossalarga ega (bunda  $\forall x, y, z \in R^n$ )

- 1)  $\rho(x, y) \geq 0$  va  $\rho(x, y) = 0 \Leftrightarrow x = y$ ,
- 2)  $\rho(x, y) = \rho(y, x)$ ,
- 3)  $\rho(x, z) \leq \rho(x, y) + \rho(y, z)$ .

Bu xossalarni isbotlaylik (12.3) munosabatdan  $\rho(x, y)$  miqdorning har doim manfiy emasligini ko'ramiz. Agar  $\rho(x, y) = 0$  bo'lsa, unda  $y_1 - x_1 = 0$ ,  $y_2 - x_2 = 0 \dots y_n - x_n = 0$  bo'lib,  $x_1 = y_1$ ,  $x_2 = y_2 \dots x_n = y_n$  ya'ni  $x = y$  bo'ladi. Aksincha  $x = y$ , ya'ni  $x_1 = y_1$ ,  $x_2 = y_2 \dots x_n = y_n$  bo'lsa, u holda (12.3) dan  $\rho(x, y) = 0$  bo'lishi kelib chiqadi. Bu esa 1)-xossani isbotlaydi.

(12.3) munosabatdan

$$\begin{aligned} \rho(x, y) &= \sqrt{(y_1 - x_1)^2 + (y_2 - x_2)^2 + \dots + (y_n - x_n)^2} = \\ &= \sqrt{(x_1 - y_1)^2 + (x_2 - y_2)^2 + \dots + (x_n - y_n)^2} = \rho(y, x) \end{aligned}$$

bo'ladi.

Masofaning 3)-xossasi ushbu

$$\sqrt{\sum_{i=1}^n (a_i + b_i)^2} \leq \sqrt{\sum_{i=1}^n a_i^2} + \sqrt{\sum_{i=1}^n b_i^2} \quad (12.4)$$

tengsizlikka asoslanib isbotlanadi, bunda  $a_1, a_2, \dots, a_n$ ;  $b_1, b_2, \dots, b_n$  ixtiyoriy haqiqiy sonlar. Avvalo shu tengsizlikning to'g'riligini ko'rsataylik. Ravshanki,  $\forall x \in R$  uchun

$$\sum_{i=1}^n (ax_i + b)^2 \geq 0.$$

Bundan,  $x$  ga nishatan kvadrat uchxadning manfiy emasligi

$$\left( \sum_{i=1}^n a_i^2 \right)x^2 + \left( 2 \sum_{i=1}^n a_i b_i \right)x + \sum_{i=1}^n b_i^2 \geq 0$$

kelib chiqadi. Demak, bu kvadrat uchxad ikkita turli haqiqiy ildizga ega bo'lmaydi. Binobarin, uning diskriminanti

$$- \sum_{i=1}^n a_i^2 \sum_{j=1}^n b_j^2 + \left[ \sum_{i=1}^n a_i b_i \right]^2 \leq 0$$

bo'lishi kerak. Bundan esa

$$\sum_{i=1}^n a_i b_i \leq \sqrt{\sum_{i=1}^n a_i^2} \cdot \sqrt{\sum_{i=1}^n b_i^2}$$

bo'lib,

$$\sum_{i=1}^n a_i^2 + \sum_{i=1}^n b_i^2 + 2 \sum_{i=1}^n a_i b_i \leq \left[ \sqrt{\sum_{i=1}^n a_i^2} \right]^2 + \left[ \sqrt{\sum_{i=1}^n b_i^2} \right]^2 + 2 \sqrt{\sum_{i=1}^n a_i^2} \sqrt{\sum_{i=1}^n b_i^2}$$

bo'ldi. Keyingi tengsizlikdan esa

$$\sqrt{\sum_{i=1}^n (a_i + b_i)^2} \leq \sqrt{\sum_{i=1}^n a_i^2} + \sqrt{\sum_{i=1}^n b_i^2}$$

bo'lishi kelib chiqadi. Odatda (12.4) tengsizlik Koshi-Bunyakovskiy tengsizlik deb ataladi.

Ixtiyoriy  $x = (x_1, x_2, \dots, x_m) \in R^m$ ,  $y = (y_1, y_2, \dots, y_m) \in R^m$ ,  $z = (z_1, z_2, \dots, z_m) \in R^m$  nuqtalarni olib, ular orasidagi masofani (12.3) formuladan foydalaniib topamiz:

$$\rho(x, y) = \sqrt{\sum_{i=1}^m (y_i - x_i)^2}.$$

$$\rho(y, z) = \sqrt{\sum_{i=1}^m (z_i - y_i)^2}. \quad (12.5)$$

$$\rho(x, z) = \sqrt{\sum_{i=1}^m (z_i - x_i)^2}.$$

Endi Koshi-Bunyakovskiy tengsizligi (12.4) da

$$a_i = y_i - x_i, \quad b_i = z_i - y_i, \quad (i = 1, 2, \dots, m)$$

deb olsak, unda

$$a_i + b_i = z_i - x_i, \quad (i = 1, 2, \dots, m)$$

bo'lib,

$$\sqrt{\sum_{i=1}^m (z_i - x_i)^2} \leq \sqrt{\sum_{i=1}^m (y_i - x_i)^2} + \sqrt{\sum_{i=1}^m (z_i - y_i)^2}$$

bo'ldi. Yuqoridagi (12.5) munosabatlarni e'tiborga olib, topamiz:

$$\rho(x, z) \leq \rho(x, y) + \rho(y, z).$$

Bu esa 3)-xossani isbotlaydi.

$R^m$  to'plam  $R^m$  fazo ( $m$  o'lchovli Evklid fazosi) deb ataladi. Endi  $R^m$  fazoning ba'zi bir muhim to'plamlarini keltiramiz.

Biror  $a = (a_1, a_2, \dots, a_m) \in R^m$  nuqta va  $r > 0$  sonni olaylik. Quyidagi

$$\{x = (x_1, x_2, \dots, x_m) \in R^m : (x_1 - a_1)^2 + (x_2 - a_2)^2 + \dots + (x_m - a_m)^2 \leq r^2\}, \quad (12.6)$$

$$\{x = (x_1, x_2, \dots, x_m) \in R^m : (x_1 - a_1)^2 + (x_2 - a_2)^2 + \dots + (x_m - a_m)^2 < r^2\}, \quad (12.7)$$

ya'ni

$$\{x \in R^m : \rho(x, a) \leq r\},$$

$$\{x \in R^m : \rho(x, a) < r\}$$

to'plamlar mos ravishda shar hamda ochiq shar deb ataladi. Bunda  $a$  nuqta shar markazi,  $r$  esa shar radiusi deyliladi.

Ushbu

$$\{x = (x_1, x_2, \dots, x_m) \in R^m : (x_1 - a_1)^2 + (x_2 - a_2)^2 + \dots + (x_m - a_m)^2 = r^2\}$$

ya'ni

$$\{x \in R^m : \rho(x, a) = r\}$$

to'plam sfera deb ataladi. Bu sfera (12.6) va (12.7) to'plamlarning chegarasi bo'ladi.

Ushbu

$$\begin{cases} \mathbf{x} = (x_1, x_2, \dots, x_m) \in R^m : a_1 \leq x_1 \leq b_1, a_2 \leq x_2 \leq b_2, \dots, a_m \leq x_m \leq b_m, \\ \mathbf{x} = (x_1, x_2, \dots, x_m) \in R^m : a_1 < x_1 < b_1, a_2 < x_2 < b_2, \dots, a_m < x_m < b_m \end{cases}$$

to'plamlar (bunda  $a_1, a_2, \dots, a_m; b_1, b_2, \dots, b_m$  haqiqiy sonlar) mos ravishda parallelepiped hamda ochiq parallelepiped deb ataladi.

Ushbu

$$\{ \mathbf{x} = (x_1, x_2, \dots, x_m) \in R^m : x_1 \geq 0, x_2 \geq 0, \dots, x_m \geq 0, x_1 + x_2 + \dots + x_m \leq h \}$$

to'plam ( $m$  o'lchovli) simpleks deb ataladi, bunda  $h$ - musbat son.

Yuqorida keltirilgan to'plamlar tez-tez ishlatalib turiladi. Ular yordamida muhim tushunchalar, jumladan atrof tushunchasi ta'riflanadi.

**2<sup>nd</sup>.  $R^m$  fazoda ochiq va yopiq to'plamlar.** Biror  $\mathbf{x}^0 = (x_1^0, x_2^0, \dots, x_m^0) \in R^m$  nuqta hamda  $\varepsilon > 0$  sonni olaylik.

**2-ta'rif.** Markazi  $\mathbf{x}^0$  nuqtada, radiusi  $\varepsilon > 0$  ga teng bo'lgan ochiq shar  $\mathbf{x}^0$  nuqtaning sferik atrofi ( $\varepsilon$  atrofi) deyiladi va  $U_\varepsilon(\mathbf{x}^0)$  kabi belgilanadi:

$$U_\varepsilon(\mathbf{x}^0) = \{ \mathbf{x} \in R^m : \rho(\mathbf{x}, \mathbf{x}^0) < \varepsilon \}.$$

Nuqtaning boshqacha atrofi tushunchasini ham kiritishimiz mumkin.

**3-ta'rif.** Ushbu

$$\begin{aligned} \mathbf{x} = (x_1, x_2, \dots, x_m) \in R^m : & x_1^0 - \delta_1 < x_1 < x_1^0 + \delta_1, \\ & x_2^0 - \delta_2 < x_2 < x_2^0 + \delta_2, \dots, x_m^0 - \delta_m < x_m < x_m^0 + \delta_m \end{aligned} \quad (12.8)$$

ochiq parallelepiped  $\mathbf{x}^0$  nuqtaning parallelepipedial atrofi deb ataladi va  $U_{\delta_1, \delta_2, \dots, \delta_m}(\mathbf{x}^0)$  kabi belgilanadi.

Xususan  $\delta_1 = \delta_2 = \dots = \delta_m = \delta$  bo'lsa, (12.8) ochiq parallelepiped kubga aylanadi va uni  $U_\delta(\mathbf{x}^0)$  kabi belgilanadi.

**1-lemma.**  $\mathbf{x}^0 \in R^m$  nuqtaning har qanday  $U_\varepsilon(\mathbf{x}^0)$  sferik atrofi olinganda ham har doim  $\mathbf{x}^0$  nuqtaning shunday  $U_{\delta_1, \delta_2, \dots, \delta_m}(\mathbf{x}^0)$  parallelepipedial atrofi mavjudki, bunda

$$U_{\delta_1, \delta_2, \dots, \delta_m}(\mathbf{x}^0) \subset U_\varepsilon(\mathbf{x}^0)$$

bo'ladi.

Shuningdek,  $\mathbf{x}^0$  nuqtaning har qanday  $U_{\delta_1, \delta_2, \dots, \delta_m}(\mathbf{x}^0)$  parallelepipedial atrofi olinganda ham har doim shu nuqtaning shunday  $U_\varepsilon(\mathbf{x}^0)$  sferik atrofi mavjudki, bunda

$$U_\varepsilon(\mathbf{x}^0) \subset U_{\delta_1, \delta_2, \dots, \delta_m}(\mathbf{x}^0)$$

bo'ladi.

◀  $\mathbf{x}^0 \in R^m$  nuqtaning sferik atrofi

$$U_\varepsilon(x^0) = \{x \in R^m : \rho(x, x^0) < \varepsilon\}$$

berilgan bo'lsin. Bundagi  $\varepsilon > 0$  songa ko'ra  $\delta < \frac{\varepsilon}{\sqrt{m}}$  tengsizlikni qanoatlantiruvchi  $\delta > 0$  sonni olamiz. So'ng  $x^0$  nuqtanining ushbu

$$U_\varepsilon(x^0) = \{x = (x_1, x_2, \dots, x_m) \in R^m : x_i^0 - \delta < x_i < x_i^0 + \delta, \\ , x_2^0 - \delta < x_2 < x_2^0 + \delta, \dots, x_m^0 - \delta < x_m < x_m^0 + \delta\}$$

parallelepipedial atrofni tuzamiz.

Aytaylik,  $x \in U_\varepsilon(x^0)$  bo'lsin. Unda  $|x_i - x_i^0| < \delta$  ( $i = 1, 2, \dots, m$ ) bo'lib,

$$\sqrt{\sum_{i=1}^m (x_i - x_i^0)^2} < \sqrt{\sum_{i=1}^m \delta^2} = \delta\sqrt{m}$$

bo'ladi. Yuqoridagi  $\delta < \frac{\varepsilon}{\sqrt{m}}$  tengsizlikni e'tiborga olib topamiz:

$$\rho(x, x^0) = \sqrt{\sum_{i=1}^m (x_i - x_i^0)^2} < \varepsilon.$$

Demak,  $\rho(x, x^0) < \varepsilon$ . Bu esa  $x \in U_\varepsilon(x^0)$  ekanini bildiradi. Shunday qilib,

$$\forall x \in U_\delta(x^0) \Rightarrow x \in U_\varepsilon(x^0)$$

ya'ni

$$U_\delta(x^0) \subset U_\varepsilon(x^0)$$

bo'ladi.

$x^0 \in R^m$  nuqtanining

$$U_{\delta_1, \delta_2, \dots, \delta_m}(x^0) = \{x = (x_1, x_2, \dots, x_m) \in R^m : x_1 - \delta_1 < x_1 < x_1^0 + \delta_1, \\ , x_2^0 - \delta_2 < x_2 < x_2^0 + \delta_2, \dots, x_m^0 - \delta_m < x_m < x_m^0 + \delta_m\}$$

parallelepiped atrofi berilgan bo'lsin. Unda

$$\varepsilon = \min\{\delta_1, \delta_2, \dots, \delta_m\}$$

ni olib  $x^0$  nuqlanining sferik atrofi

$$U_\varepsilon(x^0) = \{x \in R^m : \rho(x, x^0) < \varepsilon\}$$

ni tuzamiz.

Aytaylik  $x \in U_\varepsilon(x^0)$  bo'lsin. U holda

$$\rho(x, x^0) = \sqrt{\sum_{i=1}^m (x_i - x_i^0)^2} < \varepsilon \leq \delta_i \quad (i = 1, 2, \dots, m)$$

bo'ladi. Demak,

$$|x_i - x_i^0| \leq \sqrt{\sum_{i=1}^m (x_i - x_i^0)^2} < \delta_i \quad (i = 1, 2, \dots, m).$$

Bundan esa  $x \in U_{\delta_1, \delta_2, \dots, \delta_n}(x^0)$  bo'lishi kelib chiqadi. Shunday qilib,

$$\forall x \in U_\epsilon(x^0) \Rightarrow x \in U_{\delta_1, \delta_2, \dots, \delta_n}(x^0)$$

ya'ni

$$U_\epsilon(x^0) \subset U_{\delta_1, \delta_2, \dots, \delta_n}(x^0)$$

bo'ladi. ▶

Aytaylik,  $R^n$  fazo va  $G$  to'plam berilgan bo'lsin:  $G \subset R^n$ .

**4-ta'rif.** Agar  $x^0 \in G$  nuqtaning shunday  $U_\delta(x^0)$  atrofi ( $\delta > 0$ ) topilsaki,

$$U_\delta(x^0) \subset G$$

bo'lsa,  $x^0$  nuqta  $G$  to'plamning ichki nuqtasi deyiladi.

**5-ta'rif.** To'plamning har bir nuqtasi uning ichki nuqtasi bo'lsa, u ochiq to'plam deb ataladi.

**12.1-misol.**  $R^n$  fazodagi ochiq shar ochiq to'plam bo'lishi isbotlansin.

◀ Aytaylik,

$$A = \{x \in R^n : \rho(x, x^0) < r\}$$

$R^n$  fazodagi biror ochiq shar bo'lsin. Ravshanki,  $z \in A \Rightarrow \rho(z, x^0) < r$ .

Ushbu  $r_1 = r - \rho(z, x^0)$  sonni olib, quyidagi

$$B = \{x \in R^n : \rho(x, x^0) < r_1\}$$

sharni qaraymiz.  $\forall y \in B$  uchun,

$$\rho(y, x^0) \leq \rho(y, z) + \rho(z, x^0) < r_1 + \rho(z, x^0)$$

munosabatga ko'ra

$$B \subset A$$

bo'ladi. ▶

$R^n$  fazoda biror  $F$  to'plam va biror  $x^c$  nuqta berilgan bo'lsin.

**6-ta'rif.** Agar

$$\forall r > 0, \exists x \in F, x \neq x^0 : x \in \{x \in R^n : \rho(x, x^0) < r\}$$

bo'lsa,  $x^0$  nuqta  $F$  to'plamning limit nuqtasi deyiladi.

Masalan, ushbu

$$A = \{x \in R^n : \rho(x, x^0) \leq r\}$$

sharning barcha nuqtalari uning limit nuqtalari bo'ladi.

**7-ta'rif.**  $F \subset R^n$  to'plamning barcha limit nuqtalari shu to'plamga tegishli bo'lsa,  $F$  yopiq to'plam deb ataladi.

Masalan,

$$E = \{x \in R^n : \rho(x, x^0) \leq r\}$$

yopiq to'plam bo'ladi.

Shuni ta'kidlash lozimki, ochiq va yopiq to'plamlar ta'riflarini qanoatlantirmaydigan to'plamlar ham ko'pdir.

Biror  $M \subset R^n$  to'plamni qaraylik. Ravshanki,  $R^n \setminus M$  ayirma  $M$  to'plamni  $R^n$  to'plamga to'ldiruvchi to'plam bo'ladi. (qaralsin I-qism, I-hob, I-8).

**8-ta'rif.** Agar  $x^0 (x^0 \in R^n)$  nuqtaning istalgan  $U_r(x^0)$  atrofida ham  $M$  to'plamning, ham  $R^n \setminus M$  to'plamning nuqtalari bo'lsa,  $x^0$  nuqta  $M$  to'plamning chegaraviy nuqtasi deb ataladi.  $M$  to'plamning barcha chegaraviy nuqtalaridan iborat to'plam  $M$  to'plamning chegarasi deyiladi va uni odatda  $\partial(M)$  kabi belgilanadi.

Bu tushuncha yordamida yopiq to'plamni quyidagicha ham ta'riflash mumkin.

**9-ta'rif.** Agar  $F (F \subset R^n)$  to'plamning chegarasi shu to'plamga tegishli, ya'ni  $\partial(F) \subset F$  bo'lsa,  $F$  yopiq to'plam deb ataladi.

Yopiq to'plamning yuqorida keltirilgan 12.7- va 12.9- ta'riflari ekvivalent ta'riflardir.

Biror  $M \subset R^n$  to'plam berilgan bo'lsin.

**10-ta'rif.** Agar  $R^n$  fazoda shunday shar

$$U^0 = \{x \in R^n \mid \rho(x, 0) < r\} \quad (0 = (0, 0, \dots, 0))$$

topilsaki,  $M \subset U^0$  bo'lsa,  $M$  chegaralangan to'plam deb ataladi.

Faraz qilaylik,  $x_1(t), x_2(t), \dots, x_m(t)$  funksiyalarning har biri  $[a, b]$  segmentda uzlusiz bo'lsin.

Ushbu

$$\{x_1(t), x_2(t), \dots, x_m(t)\} \quad (a < t \leq b) \quad (12.9)$$

sistema yoki nuqtalar to'plami  $R^n$  fazoda egri chiziq deb ataladi. Xususan,

$$x_1 = \alpha_1 t + \beta_1, \quad x_2 = \alpha_2 t + \beta_2, \dots, \quad x_m = \alpha_m t + \beta_m$$

( $-\infty < t < +\infty$ ,  $\alpha_1, \alpha_2, \dots, \alpha_m; \beta_1, \beta_2, \dots, \beta_m$  haqiqiy sonlar va  $\alpha_1, \alpha_2, \dots, \alpha_m$  larning xech bo'lmaganda bittasi noiga teng emas) bo'lganda (12.9) sistema  $R^n$  fazoda to'g'ri chiziq deyiladi.

$R^n$  fazoda ixtiyoriy ikkita  $x' = (x'_1, x'_2, \dots, x'_m)$  va  $x'' = (x''_1, x''_2, \dots, x''_m)$  nuqtani olaylik. Bu nuqtalar orqali o'tuvchi to'g'ri chiziq quyidagi

$$\{(x'_1 + t(x''_1 - x'_1), x'_2 + t(x''_2 - x'_2), \dots, x'_m + t(x''_m - x'_m))\} \quad (-\infty < t < +\infty) \quad (12.10)$$

sistemasi bilan ifodalanadi. Runda  $t=0$  va  $t=1$  bo'lganda  $R^n$  fazoning mos ravishda  $x'$  va  $x''$  nuqtalari hosil bo'lib,  $0 \leq t \leq 1$  bo'lganda (12.10) sistema  $R^n$  fazoda  $x'$  va  $x''$  nuqtalarni birlashtiruvchi to'g'ri chiziq kesmasi bo'ladi.

$R^n$  fazoda chekli sondagi to'g'ri chiziq kesmalarni birin-ketin birlashtirishdan tashkil topgan chiziq, siniq chiziq deb ataladi.

$M \subset R^n$  to'plam berilgan bo'lsin.

**11-ta'rif.** Agar  $M$  to'plamning ixtiyoriy ikki nuqtasini birlashtiruvchi shunday siniq chiziq topilsaki, u  $M$  to'plamga tegishli bo'lsa,  $M$  bog'lamli to'plam deb ataladi.

**12-ta'rif.** Agar  $M \subset R^n$  to'plam ochiq hamda bog'lamli to'plam bo'lsa, u soha deb ataladi.

$R^m$  fazoda ochiq parallelepiped, ochiq shar, ochiq simplekslar fazodagi sohalar bo'ladi.

### 2-§. $R^m$ fazoda ketma-ketlik va uning limiti

Natural sonlar to'plamini  $N$  va  $R^m$  fazo berilgan bo'lib,  $f$  har bir  $n(n \in N)$  ga  $R^m$  fazoning hiror muayyan  $x^{(n)} = (x_1^{(n)}, x_2^{(n)}, \dots, x_m^{(n)}) \in R^m$  nuqtasini mos qo'yuvchi akslantirish bo'lsin:

$$f : N \rightarrow R^m \text{ yoki } n \rightarrow x^n = (x_1^{(n)}, x_2^{(n)}, \dots, x_m^{(n)}).$$

Bu akslantirishni quyidagicha tasvirlash mumkin:

$$1 \rightarrow x^{(1)} = (x_1^{(1)}, x_2^{(1)}, \dots, x_m^{(1)}),$$

$$2 \rightarrow x^{(2)} = (x_1^{(2)}, x_2^{(2)}, \dots, x_m^{(2)}),$$

$$\dots$$

$$n \rightarrow x^{(n)} = (x_1^{(n)}, x_2^{(n)}, \dots, x_m^{(n)}).$$

$f : N \rightarrow R^m$  akslantirishning tasvirlari (obrazlari) dan tuzilgan

$$x^{(1)}, x^{(2)}, \dots, x^{(n)}, \dots$$

to'plam ketma-ketlik deb ataladi va u  $\{x^{(n)}\}$  kabi belgilanadi. Har bir  $x^{(n)} \in R^m$  ( $n = 1, 2, \dots$ ) ni ketma-ketlikning hadi deyiladi.

Shuni ta'kidlash kerakki,  $\{x^{(n)}\}$  ketma-ketlikning mos koordinatalardan tuzilgan  $\{x_1^{(n)}\}, \{x_2^{(n)}\}, \dots, \{x_m^{(n)}\}$  lar sonli ketma-ketliklar bo'lib,  $\{x^{(n)}\}$  ketma-ketlikni shu  $m$  ta ketma-ketlikning (ma'lum tartibdagi) birqalikda qaralishi deb hisoblash mumkin.

#### 1<sup>q</sup>. Ketma-ketlikning limiti.

$R^m$  fazoda biror

$$x^{(1)}, x^{(2)}, \dots, x^{(n)}, \dots \quad (12.11)$$

ketma-ketlik hamda  $a = (a_1, a_2, \dots, a_m) \in R^m$  nuqta berilgan bo'lsin.

**13-ta'rif.** Agar  $\forall \varepsilon > 0$  olinganda ham, shunday  $n_0 \in N$  topilsaki, barcha  $n > n_0$  uchun

$$\rho(x^n, a) < \varepsilon$$

tengsizlik bajarilsa,  $a$  nuqta  $\{x^{(n)}\}$  ketma-ketlikning limiti deb ataladi va  $\lim_{n \rightarrow \infty} x^n = a$  yoki  $n \rightarrow \infty$  da  $x^n \rightarrow a$  kabi belgilanadi.

1-§da keltirilgan  $a$  nuqtaning  $\varepsilon$ -atrosi ta'rifini e'tiborga olib,  $\{x^{(n)}\}$  ketma-ketlikning limitini quyidagicha ham ta'riflasa bo'ladi.

**14-ta'rif.** Agar  $a$  nuqtaning ixtiyoriy  $U_\varepsilon(a)$  atrosi olinganda ham,  $\{x^{(n)}\}$  ketma-ketlikning biror hadidan boshlab, keyingi barcha hadlari shu atrofga tegishli bo'lsa,  $a$  nuqta  $\{x^{(n)}\}$  ketma-ketlikning limiti deb ataladi.

Agar (12.11) ketma-ketlik limitga ega bo'lsa, u yaqinlashuvchi ketma-ketlik deb ataladi.

Limit ta'rifidagi shartni qanoatlaniruvchi  $a$  mavjud bo'lmasa,  $\{x^{(n)}\}$  ketma-ketlikning limitga ega emas deyiladi, ketma-ketlikning o'zi esa uzoqlashtiruvchi deb ataladi.

Shunga e'tibor berish kerakki, ketma-ketlikning limiti ta'rifidagi  $\varepsilon$  ixtiyoriy musbat son bo'lib,  $n_0 (n_0 \in N)$  esa  $\varepsilon$  ga (va, tabiiyki, qaralayotgan ketma-ketlikka) bog'liq ravishda topiladi.

**12.2-misol.**  $R^m$  fazoda ushbu  $\{x^n\} = \left\{ \left( \frac{1}{n}, \frac{1}{n}, \dots, \frac{1}{n} \right) \right\}$  ketma-ketlikning limiti  $a = (0, 0, \dots, 0)$  bo'lishi ko'rsatilsin.

►  $\forall \varepsilon > 0$  sonni olaylik. Shu  $\varepsilon$  ga ko'ra  $n_0 = \left\lceil \frac{\sqrt{m}}{\varepsilon} \right\rceil + 1$  ni topamiz. Natijada barcha  $n > n_0$  uchun

$$\rho(x^n, a) = \rho\left(\left(\frac{1}{n}, \frac{1}{n}, \dots, \frac{1}{n}\right), (0, 0, \dots, 0)\right) = \frac{\sqrt{m}}{n} < \frac{\sqrt{m}}{n_0} = \frac{\sqrt{m}}{\left\lceil \frac{\sqrt{m}}{\varepsilon} \right\rceil + 1} < \varepsilon$$

bo'ladi. Demak, ta'rifga ko'ra,

$$\lim_{n \rightarrow \infty} x^{(n)} = \lim_{n \rightarrow \infty} \left( \frac{1}{n}, \frac{1}{n}, \dots, \frac{1}{n} \right) = (0, 0, \dots, 0) = a$$

bo'ladi. ►

$R^m$  fazoda  $\{x^{(n)}\} = \{x_1^{(n)}, x_2^{(n)}, \dots, x_m^{(n)}\}$  ketma-ketlik berilgan bo'lib, u  $a = (a_1, a_2, \dots, a_m)$  limitga ega bo'lsin. U holda limit ta'rifiga ko'ra,  $\forall \varepsilon > 0$  berilganda ham,  $\{x^{(n)}\}$  ketma-ketlikning biror  $n_0$  hadidan boshlab keyingi hadlari  $a$  nuqtanining

$$U_\varepsilon(a) = \{x \in R^m : \rho(x, a) < \varepsilon\}$$

sferik atrofiga tegishli bo'ladi. Bu sferik atrof ushbu bobning 1-§adagi 1-lemrnaga muvofiq shu  $a$  nuqtanining  $U_\varepsilon(a)$  parallelepipedial atrofining qismi bo'ladi:

$$U_\varepsilon(a) \subset U_\varepsilon(a)$$

Demak,  $\{x^{(n)}\}$  ketma-ketlikning o'sha  $n_0$  hadidan boshlab, keyingi barcha hadlari  $a$  nuqtanining  $U_\varepsilon(a)$  atrofida yotadi, ya'ni barcha  $n > n_0$  uchun

$$x^{(n)} \in U_\varepsilon(a) = \{(x_1, x_2, \dots, x_m) \in R^m : a_1 - \varepsilon < x_1 < a_1 + \varepsilon, \\ a_2 - \varepsilon < x_2 < a_2 + \varepsilon, \dots, a_m - \varepsilon < x_m < a_m + \varepsilon\}$$

bo'ladi. Bundan esa, barcha  $n > n_0$  uchun

$$a_1 - \varepsilon < x_1^{(n)} < a_1 + \varepsilon,$$

$$a_2 - \varepsilon < x_2^{(n)} < a_2 + \varepsilon,$$

.....

$$a_m - \varepsilon < x_m^{(n)} < a_m + \varepsilon$$

bo'lishi kelib chiqadi. Demak.  $\forall \varepsilon > 0$  olinganda ham shunday  $n > n_0$  topiladiki, barcha  $n > n_0$  uchun

$$|x_1^{(n)} - a_1| < \varepsilon, |x_2^{(n)} - a_2| < \varepsilon, \dots, |x_m^{(n)} - a_m| < \varepsilon$$

bo'ladi. Bu esa

$$\lim_{n \rightarrow \infty} x_1^{(n)} = a_1$$

$$\lim_{n \rightarrow \infty} x_2^{(n)} = a_2$$

.....

$$\lim_{n \rightarrow \infty} x_m^{(n)} = a_m$$

ekanligini bildiradi.

Shunday qilib,  $R^m$  fazoda  $\{x^{(n)}\} = \{x_1^{(n)}, x_2^{(n)}, \dots, x_m^{(n)}\}$  ketma-ketlikning limiti  $a = (a_1, a_2, \dots, a_m)$  bo'lsa, u holda bu ketma-ketlikning koordinatalaridan tashkil topgan sonlar ketma-ketliklari  $\{x_1^{(n)}\}, \{x_2^{(n)}\}, \dots, \{x_m^{(n)}\}$  ham limitga ega bo'lib, ular mos ravishda  $a$  nuqtaning  $a_1, a_2, \dots, a_m$  koordinatalariga teng bo'ladi.

Demak,

$$\lim_{n \rightarrow \infty} x^{(n)} = a \Rightarrow \begin{cases} \lim_{n \rightarrow \infty} x_1^{(n)} = a_1 \\ \lim_{n \rightarrow \infty} x_2^{(n)} = a_2, \\ \dots \\ \lim_{n \rightarrow \infty} x_m^{(n)} = a_m \end{cases} \quad (12.12)$$

Endi  $R^m$  fazoda ketma-ketlikning koordinatalaridan tashkil topgan  $\{x_1^{(n)}\}, \{x_2^{(n)}\}, \dots, \{x_m^{(n)}\}$  sonlar ketma-ketliklari limitga ega bo'lib, ularning limitlari mos ravishda  $a = (a_1, a_2, \dots, a_m) \in R^m$  nuqta koordinatalari  $a_1, a_2, \dots, a_m$  larga teng bo'lisin:

$$\lim_{n \rightarrow \infty} x_1^{(n)} = a_1$$

$$\lim_{n \rightarrow \infty} x_2^{(n)} = a_2$$

.....

$$\lim_{n \rightarrow \infty} x_m^{(n)} = a_m$$

Limit ta'rifiga asosan.  $\forall \varepsilon > 0$  olinganda ham  $\frac{\varepsilon}{\sqrt{m}}$  ga ko'ra shunday

$n_0^{(1)} \in N$  topiladiki, barcha  $n > n_0^{(1)}$  uchun

$$|x_1^{(n)} - a_1| < \frac{\varepsilon}{\sqrt{m}},$$

shunday  $n_0^{(2)} \in N$  topiladiki, barcha  $n > n_0^{(2)}$  uchun

$$|x_2^{(n)} - a_2| < \frac{\varepsilon}{\sqrt{m}}$$

va xokazo, shunday  $n_0^{(m)} \in N$  topiladiki, barcha  $n > n_0^{(m)}$  uchun

$$|x_m^{(n)} - a_m| < \frac{\varepsilon}{\sqrt{m}}$$

bo'ladi. Agar  $n_0 = \max \{n_0^{(1)}, n_0^{(2)}, \dots, n_0^{(m)}\}$  deb olsak, unda barcha  $n > n_0$  uchun bir yo'la

$$|x_i^{(n)} - a_i| < \frac{\varepsilon}{\sqrt{m}} \quad (i = 1, 2, \dots, m)$$

tengsizliklar hajariladi. U holda

$$\sqrt{\sum_{i=1}^m (x_i^{(n)} - a_i)^2} < \sqrt{\sum_{i=1}^m \left(\frac{\varepsilon}{\sqrt{m}}\right)^2} = \varepsilon$$

bo'lib, undan

$$\rho(x^{(n)}, a) < \varepsilon$$

bo'lishi kelib chiqadi. Bu esa

$$\lim_{n \rightarrow \infty} x^{(n)} = a$$

ekanini bildiradi.

Demak,  $\{x^{(n)}\} = \{x_1^{(n)}, x_2^{(n)}, \dots, x_m^{(n)}\}$  ketma-ketlik koordinatalaridan tashkil topgan  $\{x_1^{(n)}\}, \{x_2^{(n)}\}, \dots, \{x_m^{(n)}\}$  sonlar ketma-ketliklarining limitlari mos ravishda  $a = (a_1, a_2, \dots, a_m)$  nuqta koordinatalari  $a_1, a_2, \dots, a_m$  langa teng bo'lsa,  $\{x^{(n)}\}$  ketma-ketlikning limiti yuqoridagi ta'rif ma'nosida shu  $a$  nuqta bo'ladi:

$$\left. \begin{array}{l} \lim_{n \rightarrow \infty} x_1^{(n)} = a_1 \\ \lim_{n \rightarrow \infty} x_2^{(n)} = a_2 \\ \dots \\ \lim_{n \rightarrow \infty} x_m^{(n)} = a_m \end{array} \right\} \Rightarrow \lim_{n \rightarrow \infty} x^{(n)} = a. \quad (12.13)$$

Yuqoridagi (12.12) va (12.13) munosabatlardan

$$\lim_{n \rightarrow \infty} x^{(n)} = a \Leftrightarrow \begin{cases} \lim_{n \rightarrow \infty} x_1^{(n)} = a_1 \\ \lim_{n \rightarrow \infty} x_2^{(n)} = a_2 \\ \dots \\ \lim_{n \rightarrow \infty} x_m^{(n)} = a_m \end{cases}$$

ekanligi kelib chiqadi.

Shunday qilib, quyidagi muhim teoremaga kelamiz:

**I-teorema**  $R^m$  fazoda  $\{x^{(n)}\} = \{x_1^{(n)}, x_2^{(n)}, \dots, x_m^{(n)}\}$  ketma-ketlikning  $a = (a_1, a_2, \dots, a_m) \in R^m$  ga intilishi

$$x^{(n)} \rightarrow a \quad (n \rightarrow \infty \text{ da})$$

uchun  $n \rightarrow \infty$  bir yo'la

$$x_1^{(n)} \rightarrow a_1.$$

$$x_2^{(n)} \rightarrow a_2.$$

.....

$$x_m^{(n)} \rightarrow a_m$$

bo'lishi zarur va yetarli.

Bu teorema  $R^m$  fazoda ketma-ketlikning limitini o'rganishni sonli ketma-ketliklarning limitini o'rganishga keltirilishini ifodalaydi. Ma'lumki, «Matematik analiz asoslari» kursining 1-qism. 3-bobida ketma-ketligi va uning limiti batafsil o'rganilan.

#### 2º. Ketma-ketlik limitiga doir ba'zi tasdiqlar

Sonlar ketma-ketligi limiti haqidagi ma'lumotlar (tushuncha va tasdiqlar)  $R^m$  fazo nuqtalaridan iborat ketma-ketliklarda ham o'rinni bo'ladi. Quyida biz ularni keltirish bilangina kifoyalanamiz (keltirilgan tasdiqlarni isbotlashni o'quvchiga havola etamiz).

1)  $R^m$  fazoda  $\{x^{(n)}\} = \{x_1^{(n)}, x_2^{(n)}, \dots, x_m^{(n)}\}$  ketma-ketlikning chegaralangan bo'lishi uchun bu ketma-ketlik koordinatalardan iborat  $\{x_1^{(n)}\}, \{x_2^{(n)}\}, \dots, \{x_m^{(n)}\}$  sonlar ketma-ketliklarning har birining chegaralangan bo'lishi zarur va yetarli.

2)  $R^m$  fazoda  $\{x^{(n)}\}$  ketma-ketlik uchun  $\forall \varepsilon > 0$  olinganda ham shunday  $n_0 \in N$  topilsaki, barcha  $n > n_0$ ,  $\rho > n_0$  da

$$\rho(x^{(n)}, x^{(n)}) < \varepsilon$$

tengsizlik bajarilsa,  $\{x^{(n)}\}$  fundamental ketma-ketlik deyiladi.

$R^m$  fazoda  $\{x^{(n)}\} = \{x_1^{(n)}, x_2^{(n)}, \dots, x_m^{(n)}\}$  ketma-ketlik fundamental bo'lishi uchun bu ketma-ketlik koordinatalaridan iborat  $\{x_1^{(n)}\}, \{x_2^{(n)}\}, \dots, \{x_m^{(n)}\}$  ketma-ketliklarning har birining fundamental bo'lishi zarur va yetarli.

$R^m$  fazoda  $\{x^{(n)}\}$  ketma-ketlikning yaqinlashuvchi bo'lishi uchun u fundamental bo'lishi zarur va yetarli (Koshi teoremasi).

3) Markazlari  $a^{(n)} = (a_1^{(n)}, a_2^{(n)}, \dots, a_m^{(n)}) \in R^m$  nuqtalarda, radiuslari  $r_n$  ( $r_n > 0$ ,  $n = 1, 2, \dots$ ) bo'lgan

$$S_n = S_n(a^{(n)}, r_n) = \{x \in R^m \mid \rho(x, a^{(n)}) \leq r_n\} \quad (n = 1, 2, 3, \dots)$$

sharlar berilgan bo'lsin. Agar

$$S_1 \supset S_2 \supset \dots \supset S_n \supset \dots$$

munosabat o'rini bo'lsa,  $\{S_n\}$  ichma-ich joylashgan sharlar ketma-ketligi deyiladi.

Agar  $R^m$  fazoda ichma-ich joylashgan sharlar ketma-ketligi  $\{S_n\}$  uchun

$$\lim_{n \rightarrow \infty} r_n = 0$$

bo'lsa, u holda barcha sharlarga tegishli bo'lgan  $a (a \in R^m)$  nuqta mavjud va yagonadir. (Ichma-ich joylashgan sharlar prinsipi).

4)  $R^m$  fazoda  $\{x^{(n)}\}$ :

$$x^{(1)}, x^{(2)}, \dots, x^{(n)}, \dots \quad (x^{(n)} \in R^m, \quad n = 1, 2, \dots)$$

ketma-ketlik berilgan bo'lsin. Bu ketma-ketlikning

$$n_1, n_2, \dots, n_k, \dots \quad (n_1 < n_2 < \dots < n_k < \dots, n_k \in N, k = 1, 2, \dots)$$

nomerli hadlardan tashkil topgan ushu

$$x^{(n_1)}, x^{(n_2)}, \dots, x^{(n_k)}, \dots \quad (x^{(n_k)} \in R^m)$$

ketma-ketlik  $\{x^{(n)}\}$  ketma-ketlikning qismiy ketma-ketligi deyiladi va  $\{x^{(n_k)}\}$  kabi belgilanadi.

Agar  $\{x^{(n)}\}$  ketma-ketlik yaqinlashuvchi bo'lib, uning limiti  $a (a \in R^m)$  bo'lsa, bu ketma-ketlikning har qanday qismiy  $\{x^{(n_k)}\}$  ketma-ketligi ham yaqinlashuvchi bo'lib, uning limiti ham  $a$  ga teng bo'ladi.

Har qanday chegaralangan  $\{x^{(n)}\}$  ketma-ketlikdan yaqinlashuvchi qismiy ketma-ketlik ajratish mumkin. (Baltsano-Veyershtress teoremasi).

### 3-§. Ko'p o'zgaruvchili funksiya va uning limiti

*I". Funksiya.* Biror  $M (M \subset R^m)$  to'plam berilgan bo'lsin.

*IS-ta'rif.* Agar  $M$  to'plamdag'i har bir  $x = (x_1, x_2, \dots, x_m)$  nuqtaga biror qoida yoki qonunga ko'ra bitta haqiqiy son  $y (y \in R)$  mos qo'yilgan bo'lsa,  $M$  to'plamda ko'p o'zgaruvchili ( $m$  ta o'zgaruvchili) funksiya berilgan (aniqlangan) deb ataladi va uni

$$f (x_1, x_2, \dots, x_m) \rightarrow y \text{ yoki } y = f(x_1, x_2, \dots, x_m) \quad (12.14)$$

kabi belgilanadi. Bunda  $M$ -funksiyaning berilishi (aniqlanish) to'plami,  $x_1, x_2, \dots, x_m$  erkli o'zgaruvchilar - funksiya argumentlari,  $y$  erksiz o'zgaruvchi -  $x_1, x_2, \dots, x_m$  o'zgaruvchilarining funksiyasi deyiladi.

$(x_1, x_2, \dots, x_m)$  nuqta bitta  $x$  bilan belgilanishini e'tiborga olib, bundan keyin deyarli hamma vaqt  $(x_1, x_2, \dots, x_m)$  o'miga  $x$  ni ishlataveramiz. Unda yuqoridaqgi (12.14) belgilashlar quyidagicha yoziladi:

$$f : x \rightarrow y \text{ yoki } y = f(x) \quad (x \in R^m, y \in R).$$

Funksiyaning berilish to'plamidan olingan  $x^0 \in M$  nuqtaga mos keluvchi  $y_0$  son  $y = f(x)$  funksiyaning  $x = x^0$  nuqtadagi xususiy qiymati deb ataladi.

Masalan,  $f : R^m$  fazodagi har bir  $x$  nuqtaga shu nuqta koordinatalari kvadratlarining yig'indisini mos qo'yuvchi qoida, ushbu

$$f: x \rightarrow x_1^2 + x_2^2 + \dots + x_m^2 \quad y = x_1^2 + x_2^2 + \dots + x_m^2$$

funksiyani hosil qiladi. Bu funksiya  $M = R^m$  to'plamda berilgan.

$f(x)$  funksiya  $M \subset R^m$  to'plamda berilgan bo'lsin. Ushbu  $\{f(x), x \in M\}$  to'plam funksiya qiymatlari to'plami (funksiyaning o'zgarish sohasi) deb ataladi.

$R^{m+1}$  fazoning  $(x, y)$  ( $x \in R^m, y = f(x) \in R$ ) nuqtalardan iborat ushbu

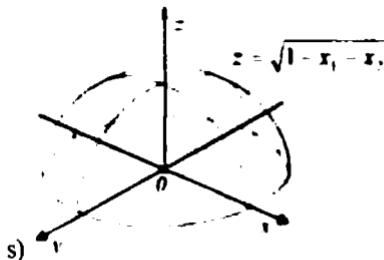

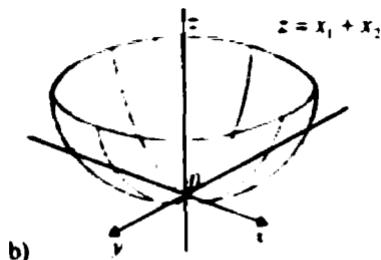

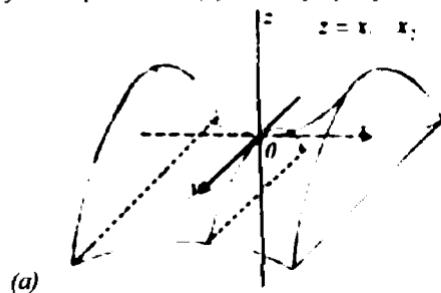

$$\{(x, f(x))\} = \{(x, f(x)) : x \in R^m, f(x) \in R\}$$

to'plam  $y = f(x)$  funksiya grafigi deb ataladi.

Masalan,  $m = 2$  bo'lganda ( $R^2$  fazoda)

$$y = x_1, x_2, \quad y = x_1^2, x_2^2, \quad y = \sqrt{1 - x_1^2 - x_2^2}$$

funksiyalar grafigi (47-chizma) mos ravishda  $R^1$  fazoda giperbolik paraboloid (a), aylanma paraboloid (b) hamda yuqori yarim sferalar (s) dan iboratdir.

#### 47-chizma

$M \subset R^m$  to'plamda  $y = f(x) = f(x_1, x_2, \dots, x_m)$  funksiya berilgan bo'lib,  $x_1, x_2, \dots, x_m$  larning har biri  $T \subset R^k$  ( $k \in N$ ) to'plamda berilgan funksiyalar bo'lsin:

$$x_1 = \varphi_1(t) = \varphi_1(t_1, t_2, \dots, t_k),$$

$$x_2 = \varphi_2(t) = \varphi_2(t_1, t_2, \dots, t_k)$$

$$\dots$$

$$x_m = \varphi_m(t) = \varphi_m(t_1, t_2, \dots, t_k)$$

Runda  $t = (t_1, t_2, \dots, t_k)$  o'zgaruvchi  $T \subset R^k$  to'plamda o'zgarganda ularga mos  $x = (x_1, x_2, \dots, x_m)$  nuqta  $M \subset R^m$  to'plamga tegishli bo'lsin. Natijada  $y$  o'zgaruvchi  $x = (x_1, x_2, \dots, x_m)$  o'zgaruvchi orqali  $t = (t_1, t_2, \dots, t_k)$  o'zgaruvchilarning funksiyasi bo'ladi:

$$t \rightarrow x \rightarrow y,$$

$$((t_1, t_2, \dots, t_k) \rightarrow (x_1, x_2, \dots, x_m) \rightarrow y).$$

$$y = f(x(t)) = f(\varphi_1(t_1, t_2, \dots, t_k), \varphi_2(t_1, t_2, \dots, t_k), \dots, \varphi_m(t_1, t_2, \dots, t_k)).$$

Bu murakkab funksiya yoki  $f(x)$  hamda  $\varphi_i(t)$  ( $i = 1, 2, \dots, m$ ) funksiyalar superpozitsiyasi deb ataladi.

Elementar funksiyalar ustida qo'shish, ayirish, ko'paytirish va bo'lish amallari hamda funksiyalar superpozitsiyasi yordamida ko'p o'zgaruvchili funksiyalar hosil qilinadi. Ushbu

$$y = e^{t_1 t_2 \dots t_m}, \quad y = \ln \sqrt{x_1 + x_2 + \dots + x_m},$$

$$y = \sin(x_1 x_2) + \sin(x_2 x_3) + \dots + \sin(x_{m-1} x_m)$$

funksiyalar shular jumlasidandir.

$f(x) = f(x_1, x_2, \dots, x_m)$  funksiya  $M \subset R^m$  to'plamda berilgan bo'lsin. Agar bu funksiya qiymatlari to'plami

$$Y = \{f(x_1, x_2, \dots, x_m) | (x_1, x_2, \dots, x_m) \in M\}$$

yuqorida (quyidan) chegaralangan bo'lsa, ya'nini shunday o'zgarmas  $C$  (o'zgarmas  $P$ ) son topilsaki,  $\forall (x_1, x_2, \dots, x_m) \in M$  uchun

$$f(x_1, x_2, \dots, x_m) \leq C \quad (f(x_1, x_2, \dots, x_m) \geq P)$$

tengsizlik o'rinni bo'lsa,  $f(x) = f(x_1, x_2, \dots, x_m)$  funksiya  $M$  to'plamda yuqorida (quyidan) chegaralangan deb ataladi, aks holda, ya'nini har qanday katta musbat  $S$  son olinganda ham  $M$  to'plamda shunday  $(x_1^0, x_2^0, \dots, x_m^0)$  nuqta topilsaki,

$$f(x_1^0, x_2^0, \dots, x_m^0) > S \quad (f(x_1^0, x_2^0, \dots, x_m^0) < -S)$$

tengsizlik o'rinni bo'lsa,  $f(x) = f(x_1, x_2, \dots, x_m)$  funksiya  $M$  to'plamda yuqorida (quyidan) chegaralanmagan deb ataladi.

Agar  $f(x) = f(x_1, x_2, \dots, x_m)$  funksiya  $M$  to'plamda ham yuqorida, ham quyidan chegaralangan bo'lsa, funksiya shu to'plamda chegaralangan deyiladi.

**12.3-misol.** Ushbu

$$y = \frac{\sqrt{1 - x_1^2 - x_2^2 - \dots - x_m^2}}{\ln(x_1^2 + x_2^2 + \dots + x_m^2 - \frac{1}{4})}$$

funksiyaning aniqlanish to'plami topilsin.

◀ Qaralayotgan munosabat ma'noga ega bo'lishi uchun

$$1 - x_1^2 - x_2^2 - \dots - x_m^2 \geq 0,$$

$$x_1^2 + x_2^2 + \dots + x_m^2 - \frac{1}{4} > 0$$

bo'lishi kerak. Ravshanki,

$$1 - x_1^2 - x_2^2 - \dots - x_m^2 \geq 0 \Rightarrow x_1^2 + x_2^2 + \dots + x_m^2 \leq 1 \text{ bo'lib, u } R^m \text{ fazoda}$$

$$\left\{ x \in R^m : \rho(x, 0) \leq 1 \right\}$$

sharni ( $0 = (0, 0, \dots, 0)$ ):

$$x_1^2 + x_2^2 + \dots + x_m^2 - \frac{1}{4} > 0 \Rightarrow x_1^2 + x_2^2 + \dots + x_m^2 > \frac{1}{4} \text{ bo'lib, u } R^m \text{ fazoda}$$

$$\left\{ x \in R^m : \rho(x, 0) > \frac{1}{2} \right\}$$

to'plamni (markazi  $0 = (0, 0, \dots, 0)$ ) nuqtada, radiusi  $\frac{1}{2}$  bo'lgan shar tashqarini ifodalaydi.

Demak, berilgan funksiyaning aniqlanish to'plami

$$\left\{ x \in R^m : \rho(x, 0) \leq 1 \right\} \cap \left\{ x \in R^m : \rho(x, 0) > \frac{1}{2} \right\}$$

bo'ladi. ▶

**2<sup>o</sup>. Funksiyaning limiti.**  $R^m$  fazoda biror  $M$  to'plam olaylik.  $a$  nuqta ( $a = (a_1, a_2, \dots, a_m)$ ) shu to'plamning limit nuqtasi bo'lsin. U holda  $M$  to'plamning nuqtalaridan  $a$  ga intiluvchi turli  $\{x^{(n)}\}$  ( $x^{(n)} \in M, x^{(n)} \neq a, n = 1, 2, \dots$ ) ketma-ketliklar tuzish mumkin:

$$\lim_{n \rightarrow \infty} x^{(n)} = a.$$

Endi shu  $M$  to'plamda biror  $y = f(x)$  funksiya berilgan bo'lsin.

**16.-ta'rif. (Geyne ta'rifi).** Agar  $M$  to'plamning nuqtalaridan tuzilgan  $a$  ga intiluvchi har qanday  $\{x^{(n)}\}$  ( $x^{(n)} \neq a, n = 1, 2, \dots$ )

ketma-ketlik olinganda ham mos  $\{f(x^{(n)})\}$  ketma-ketlik hamma vaqt yagona  $\epsilon$  (chekli yoki cheksiz) limitga intilsa,  $\epsilon$   $f(x)$  funksiyaning  $a$  nuqtadagi (yoki  $x \rightarrow a$  dagi) limiti deb ataladi va u

$$\lim_{n \rightarrow \infty} f(x^{(n)}) = \epsilon \text{ yoki } x \rightarrow a \text{ da } f(x) \rightarrow \epsilon$$

kabi belgilanadi.

Funksiya limitini boshqacha ham ta'riflash mumkin.

**17.-ta'rif. (Koshi ta'rifi).** Agar  $\forall \epsilon > 0$  son uchun shundan  $\delta > 0$  topilsaki, ushbu  $0 < \rho(x, a) < \delta$  tengsizlikni qanoatlantiruvchi barcha  $x \in M$  nuqtalarda

$$|f(x) - b| < \varepsilon$$

tengsizlik bajarilsa,  $\sigma$  son  $f(x)$  funksiyaning  $a$  nuqtadagi ( $x \rightarrow a$  dagi) limiti deb ataladi.

**18-ta'rif. (Koshi ta'rif).** Agar  $\forall \varepsilon > 0$  son uchun shunday  $\delta > 0$  topilsaki, ushbu  $0 < \rho(x, a) < \delta$  tengsizlikni qanoatlaniruvchi barcha  $x \in M$  nuqtalarda

$$|f(x)| > \varepsilon \quad (f(x) > \varepsilon, \quad f(x) < -\varepsilon)$$

bo'lisa,  $f(x)$  funksiyaning  $a$  nuqtadagi ( $x \rightarrow a$  dagi) limiti  $\infty (+\infty, -\infty)$  deyiladi.

Yuqoridagi  $\lim_{x \rightarrow a} f(x) = b$  yoki  $x \rightarrow a$  da  $f(x) \rightarrow b$  belgilashlarni,  $x = (x_1, x_2, \dots, x_m)$ ,  $a = (a_1, a_2, \dots, a_m)$  hamda

$$x \rightarrow a \Leftrightarrow \begin{cases} x_1 \rightarrow a_1, \\ x_2 \rightarrow a_2 \\ \dots \\ x_m \rightarrow a_m \end{cases}$$

ekanligi e'tiborga olib quyidagicha

$$\lim_{\substack{x_1 \rightarrow a_1 \\ x_2 \rightarrow a_2 \\ \dots \\ x_m \rightarrow a_m}} f(x_1, x_2, \dots, x_m) = b$$

yoki

$$\begin{aligned} &x_1 \rightarrow a_1 \\ &x_2 \rightarrow a_2 \quad \text{da } f(x_1, x_2, \dots, x_m) \rightarrow b \\ &\dots \\ &x_m \rightarrow a_m \end{aligned}$$

yozsa ham bo'ladi.

$R^n$  fazoda biror  $M$  to'plam berilgan bo'lib,  $\infty$  esa shu to'plamning limit nuqtasi bo'lsin. Bu  $M$  to'plamda  $y = f(x)$  funksiya berilgan.

**19-ta'rif. (Geyne ta'rif).** Agar  $M$  to'plamning nuqtalaridan tuzilgan har qanday  $\{x^{(n)}\}$  ketma-ketlik uchun  $x^{(n)} \rightarrow \infty$  da mos  $\{f(x^{(n)})\}$  ketma-ketlik hamma vaqt yagona  $\sigma$  ga intilsa,  $\sigma$   $f(x)$  funksiyaning  $x \rightarrow \infty$  dagi limiti deb ataladi va

$$\lim_{x \rightarrow \infty} f(x) = \sigma$$

kabi belgilanadi.

**20-ta'rif. (Koshi ta'rif).** Agar  $\forall \varepsilon > 0$  son uchun shunday  $\delta > 0$  topilsaki, ushbu  $\rho(x, 0) > \delta$  tengsizlikni qanoatlaniruvchi barcha  $x \in M$  nuqtalarda

$$|f(x) - \sigma| < \varepsilon$$

tengsizlik bajarilsa,  $\sigma$  ni  $f(x)$  funksiyaning  $x \rightarrow \infty$  dagi limiti deb ataladi va

$$\lim_{x \rightarrow \infty} f(x) = \sigma$$

kabi belgilanadi.

Shuni ta'kidlash lozimki, funksiya limiti tushunchasi kiritilishida limiti qaralayotgan nuqtada funksiyaning berilishi (aniqlanishi) shart emas.

**I-eslatma.** Yuqoridaqagi funksiya limitiga berilgan Geyne ta'rifining mohiyati, har qanday  $\{x^{(n)}\}$  ( $x^{(n)} \neq a$ ,  $n = 1, 2, \dots$ ,  $x^{(n)} \rightarrow a$ ) ketma-ketlik uchun mos  $\{f(x^{(n)})\}$  ketma-ketlikning limiti olingan  $\{x^{(n)}\}$  ketma-ketlikka bog'liq bo'lmasligidadir.

**12.4-misol.** Ushbu

$$f(x) = f(x_1, x_2) = \begin{cases} \frac{x_1 x_2}{\sqrt{x_1^2 + x_2^2}}, & \text{agar } x_1^2 + x_2^2 > 0 \text{ bo'lsa}, \\ 0, & \text{agar } x_1^2 + x_2^2 = 0 \text{ bo'lsa} \end{cases}$$

funksiyaning  $x = (x_1, x_2) \rightarrow (0, 0)$  (ya'ni  $x_1 \rightarrow 0$ ,  $x_2 \rightarrow 0$ ) dagi limiti nol ekanligi ko'rsatilsin.

◀ Bu funksiya  $R^2$  to'plamda berilgan bo'lib,  $(0, 0)$  nuqta shu to'plamning limit nuqtasi.

a) Geyne ta'ifi bo'yicha:  $(0, 0)$  nuqtaga intiluvchi ixtiyoriy  $x^{(n)} = (x_1^{(n)}, x_2^{(n)}) \rightarrow (0, 0)$  (ya'ni  $x_1^{(n)} \rightarrow 0$ ,  $x_2^{(n)} \rightarrow 0$ ,  $x^{(n)} \neq (0, 0)$ ) ketma-ketlik olamiz. Unga mos  $\{f(x^{(n)})\}$  ketma-ketlik uchun quyidagicha

$$\begin{aligned} f(x^{(n)}) &= f(x_1^{(n)}, x_2^{(n)}) = \frac{x_1^{(n)} x_2^{(n)}}{\sqrt{(x_1^{(n)})^2 + (x_2^{(n)})^2}} = \sqrt{\frac{x_1^{(n)} x_2^{(n)}}{\sqrt{(x_1^{(n)})^2 + (x_2^{(n)})^2}}} \cdot \sqrt{x_1^{(n)} x_2^{(n)}} \leq \\ &\leq \frac{1}{\sqrt{2}} \sqrt{x_1^{(n)} x_2^{(n)}} \end{aligned}$$

bo'lib,  $x_1^{(n)} \rightarrow 0$ ,  $x_2^{(n)} \rightarrow 0$  da

$$\lim_{(x_1, x_2) \rightarrow (0, 0)} f(x^{(n)}) = 0$$

bo'ladi. Demak,

$$\lim_{(x_1, x_2) \rightarrow (0, 0)} f(x) = \lim_{\substack{x_1 \rightarrow 0 \\ x_2 \rightarrow 0}} \frac{x_1 x_2}{\sqrt{x_1^2 + x_2^2}} = 0$$

b) Koshi ta'ifi bo'yicha:  $\forall \varepsilon > 0$  songa ko'ra  $\delta = 2\varepsilon$  deb olinsa, u holda  $0 < \rho(x, 0) < \delta$  tengsizlikni qanoatlantiruvchi barcha  $x$  nuqtalarda

$$|f(x) - 0| = \left| \frac{x_1 x_2}{\sqrt{x_1^2 + x_2^2}} \right| = \frac{|x_1| \cdot |x_2|}{\sqrt{x_1^2 + x_2^2}} \leq \frac{1}{2} \sqrt{x_1^2 + x_2^2} = \frac{1}{2} \rho(x, 0) < \frac{1}{2} \delta = \varepsilon$$

tengsizlik o'rini bo'ladi. Bu esa

$$\lim_{x \rightarrow (0, 0)} f(x) = \lim_{\substack{x_1 \rightarrow 0 \\ x_2 \rightarrow 0}} \frac{x_1 x_2}{\sqrt{x_1^2 + x_2^2}} = 0$$

ekanligini bildiradi. ▶

**12.5-misol.** Quyidagi

$$f(x) = f(x_1, x_2) = \frac{x_1^2 \cdot x_2^2}{x_1^2 x_2^2 + (x_1 - x_2)^2}$$

funksiyaning  $x = (x_1, x_2) \rightarrow (0, 0)$  ya'ni  $x_1 \rightarrow 0$ ,  $x_2 \rightarrow 0$  dagi limitining mavjud emasligi ko'rsatilsin.

◀ Bu funksiya  $R^2 \setminus (0, 0)$  to'plamda berilgan bo'lib,  $(0, 0)$  shu to'plamning limit nuqtasi.

$(0, 0)$  nuqtaga intiluvchi ikkita

$$x^{(n)} = \left( \frac{1}{n}, \frac{1}{n} \right) \rightarrow (0, 0)$$

$$\bar{x}^{(n)} = \left( \frac{1}{n}, -\frac{1}{n} \right) \rightarrow (0, 0)$$

ketma-ketliklar olinsa, ular uchun mos ravishda

$$f(x^{(n)}) = \frac{\frac{1}{n}}{\frac{1}{n^4}} = 1 \rightarrow 1$$

$$f(\bar{x}^{(n)}) = \frac{\frac{1}{n}}{\frac{1}{n^4} + \frac{1}{n^2}} = \frac{1}{1 + 4n^2} \rightarrow 0$$

bo'ladi. Bu esa  $x \rightarrow (0, 0)$  da berilgan funksiyaning limiti mavjud emasligini bildiradi ►

3<sup>o</sup>. *Limitga ega bo'lgan funksiyalarning xossalari.* Chekli limitga ega bo'lgan ko'p o'zgaruvchili funksiyalar ham chekli limitga ega bo'lgan bir o'zgaruvchili funksiyalarning xossalariiga (qaralsin 1-qism, 4-bob, 4-§) o'xshash xossalarga ega. Ularning isboti xuddi bir o'zgaruvchili funksiyalar xossalaring isboti kabitidir.

Biror  $M \subset R^n$  to'plamda  $f(x)$  funksiya berilgan bo'lib,  $a (a \in R^n)$  nuqta shu  $M$  to'plamning limit nuqtasi bo'lсин.

1) Agar

$$\lim_{x \rightarrow a} f(x) = \sigma$$

mavjud bo'lib,  $\sigma > p (\sigma < q)$  bo'lsa,  $a$  nuqtaning yetarli kichik atrofidagi  $x \in M (x \neq a)$  nuqtalarda  $f(x) > p$  ( $f(x) < q$ ) bo'ladi. Xususan,  $\sigma \neq 0$  bo'lsa, u holda  $a$  nuqtaning yetarlicha kichik atrofida  $f(x) \neq 0$  bo'ladi.

2) Agar

$$\lim_{x \rightarrow a} f(x) = \sigma$$

mavjud bo'lsa,  $a$  nuqtaning yetarlicha kichik  $U_\delta(a)$  atrofida ( $x \in M (x \neq a)$  nuqtalarda)  $f(x)$  funksiya chegaralangan bo'ladi.

Endi  $M \subset R^n$  da ikkita  $f_1(x)$  va  $f_2(x)$  funksiyalar berilgan bo'lсин.

3) Agar

$$\lim_{x \rightarrow a} f_1(x) = a_1, \quad \lim_{x \rightarrow a} f_2(x) = a_2$$

bo'lib, a nuqtaning  $U_\delta(a)$  atrofidagi barcha  $x$  nuqtalarda ( $x \in M \cap U_\delta(a)$ ),  $f_1(x) \leq f(x) \leq f_2(x)$  bo'lsa, u holda  $a_1 \leq a_2$  bo'ladi.

4) Agar a nuqtaning  $U_\delta(a)$  atrofidagi  $x \in M \cap U_\delta(a)$  nuqtalarda

$$f_1(x) \leq f(x) \leq f_2(x)$$

bo'lib,  $x \rightarrow a$  da  $f_1(x)$  va  $f_2(x)$  funksiyalar limitiga ega hamda

$$\lim_{x \rightarrow a} f_1(x) = \lim_{x \rightarrow a} f_2(x) = a$$

bo'lsa, u holda  $f(x)$  funksiya ham limitga ega va

$$\lim_{x \rightarrow a} f(x) = a$$

bo'ladi.

5) Agar  $x \rightarrow a$  da  $f_1(x)$  va  $f_2(x)$  funksiyalar limitiga ega bo'lsa,  $f_1(x) \pm f_2(x)$  funksiyalar limitiga ega bo'ladi va

$$\lim_{x \rightarrow a} [f_1(x) \pm f_2(x)] = \lim_{x \rightarrow a} f_1(x) \pm \lim_{x \rightarrow a} f_2(x).$$

6) Agar  $x \rightarrow a$  da  $f_1(x)$  va  $f_2(x)$  funksiyalar limitiga ega bo'lsa,  $f_1(x) \cdot f_2(x)$  funksiya ham limitga ega bo'ladi va

$$\lim_{x \rightarrow a} [f_1(x) \cdot f_2(x)] = \lim_{x \rightarrow a} f_1(x) \cdot \lim_{x \rightarrow a} f_2(x).$$

7) Agar  $x \rightarrow a$  da  $f_1(x)$  va  $f_2(x)$  funksiyalar limitiga ega bo'lib,  $\lim_{x \rightarrow a} f_2(x) \neq 0$

bo'lsa,  $\frac{f_1(x)}{f_2(x)}$  funksiya ham limitga ega bo'ladi va

$$\lim_{x \rightarrow a} \frac{f_1(x)}{f_2(x)} = \frac{\lim_{x \rightarrow a} f_1(x)}{\lim_{x \rightarrow a} f_2(x)}.$$

**2-eslatma.** Bir o'zgaruvchili funksiyalardagidek  $x \rightarrow a$  da  $f_1(x)$  va  $f_2(x)$  funksiyalar yig'indisi, ko'paytmasi va nisbatan iborat bo'lgan funksiyalarning limitiga ega bo'lishidan bu funksiyalarning har birining limitga ega bo'lishi kelib chiqavermaydi.

**3-eslatma.** Agar  $x \rightarrow a$  da 1)  $f_1(x)$  va  $f_2(x)$  funksiyalarning har birining limiti nol (yoki cheksiz) bo'lsa,  $\frac{f_1(x)}{f_2(x)}$  ifoda: 2)  $f_1(x) \rightarrow 0$ ,  $f_2(x) \rightarrow \infty$  bo'lganda  $f_1(x) \cdot f_2(x)$  ifoda va nioxoyat 3)  $f_1(x)$  va  $f_2(x)$  turli ishorali cheksiz limitga ega bo'lganda  $f_1(x) + f_2(x)$  yig'indi mos ravishda  $\frac{0}{0}$ ,  $0 \cdot \infty$ ,  $\infty - \infty$  ko'rinishdag'i aniqmasliklarni ifodalaydi.

Agar  $x \rightarrow a$  da 1)  $f_1(x) \rightarrow 0$ ,  $f_2(x) \rightarrow 0$  bo'lsa, 2)  $f_1(x) \rightarrow 1$ ,  $f_2(x) \rightarrow \infty$  bo'lsa, 3)  $f_1(x) \rightarrow \infty$ ,  $f_2(x) \rightarrow 0$  bo'lsa, u holda  $[f_1(x)]^{f_2(x)}$  mos ravishda  $0^0$ ,  $1^\infty$ ,  $\infty^0$  ko'rinishdag'i aniqmasliklarni ifodalaydi. Bunday aniqmasliklar bir o'zgaruvchili funksiyalarda qaralganidек,  $f_1(x)$  va  $f_2(x)$  funksiyaning o'z limitlariga intilish xarakteriga qarab ochiladi.

**4. Takroriy limitlur.** Biz yuqorida  $f(x) = f(x_1, x_2, \dots, x_m)$  funksiyaning  $a = (a_1, a_2, \dots, a_m)$  nuqtadagi limiti

$$\lim_{x \rightarrow a} f(x) = a \quad \left( \lim_{\substack{x_1 \rightarrow a_1 \\ x_2 \rightarrow a_2 \\ \vdots \\ x_m \rightarrow a_m}} f(x_1, x_2, \dots, x_m) = a \right)$$

bilan tanishdik. Demak, funksiyaning limiti, uning argumentlari  $x_1, x_2, \dots, x_m$  larning bir yo'la, mos ravishda  $a_1, a_2, \dots, a_m$  sonlarga intilgandagi limitidan iboradir.

Ko'p o'zgaruvchili funksiyalar uchun (ulargagina xos bo'lgan) boshqa farmadagi limit tushunchasini ham kiritish mumkin.

$f(x_1, x_2, \dots, x_m)$  funksiya  $M \subset R^m$  to'plamida berilgan bo'lib,  $a = (a_1, a_2, \dots, a_m)$  nuqta  $M$  to'plamning limit nuqtasi bo'lсин. Bu funksiyaning  $x_1 \rightarrow a_1$  dagi (boshqa barcha o'zgaruvchilarini tayinlab) limiti

$$\lim_{x_1 \rightarrow a_1} f(x_1, x_2, \dots, x_m)$$

ni qaraylik. Ravshanki, bu limit, birinchidan bir o'zgaruvchili funksiya limitining o'zginasi, ikkinchidan u  $x_2, x_3, \dots, x_m$  o'zgaruvchilarga bog'liq:

$$\lim_{x_1 \rightarrow a_1} f(x_1, x_2, \dots, x_m) = \varphi_1(x_2, x_3, \dots, x_m).$$

So'ng  $\varphi_1(x_2, x_3, \dots, x_m)$  funksiyaning  $x_2 \rightarrow a_2$  dagi (boshqa barcha o'zgaruvchilarini tayinlab) limiti

$$\lim_{x_2 \rightarrow a_2} \varphi_1(x_2, x_3, \dots, x_m) = \varphi_2(x_3, x_4, \dots, x_m)$$

ni qaraylik.

Yuqoridagidek birin-ketin  $x_3 \rightarrow a_3, x_4 \rightarrow a_4, \dots, x_m \rightarrow a_m$  da limitga o'tib

$$\lim_{x_m \rightarrow a_m} \lim_{x_{m-1} \rightarrow a_{m-1}} \dots \lim_{x_2 \rightarrow a_2} f(x_1, x_2, \dots, x_m)$$

ni hosil qilamiz. Bu limit  $f(x_1, x_2, \dots, x_m)$  funksiyaning takroriy limiti deb ataladi.

Demak, funksiyaning takroriy limiti, uning argumentlari  $x_1, x_2, \dots, x_m$  larning har birining birin-ketin mos ravishda  $a_1, a_2, \dots, a_m$  sonlarga intilgandagi limitidan iborat.

Shuni ham aytish kerakki,  $f(x_1, x_2, \dots, x_m)$  funksiya argumentlari  $x_1, x_2, \dots, x_m$  lar mos ravishda  $a_1, a_2, \dots, a_m$  sonlarga turli tartibda intilganda funksiyaning turli takroriy limitlari hosil bo'ladi.

### 12.6-misol.

Ushbu

$$f(x_1, x_2) = \begin{cases} \frac{x_1 x_2}{\sqrt{x_1^2 + x_2^2}}, & \text{agar } x_1^2 + x_2^2 > 0 \text{ bo'lsa} \\ 0, & \text{agar } x_1^2 + x_2^2 = 0 \text{ bo'lsa} \end{cases}$$

funksiyaning takroriy limitlari topilsin.

◀ Bu funksiyaning takroriy limitlari mavjud va ular ham 0 ga teng. Haqiqatdan ham,

$$\lim_{x_1 \rightarrow 0} f(x_1, x_2) = \lim_{x_1 \rightarrow 0} \frac{x_1 x_2}{\sqrt{x_1^2 + x_2^2}} = 0, \quad \lim_{x_1 \rightarrow 0} \lim_{x_2 \rightarrow 0} f(x_1, x_2) = 0.$$

Shuningdek,

$$\lim_{x_2 \rightarrow 0} f(x_1, x_2) = \lim_{x_2 \rightarrow 0} \frac{x_1 x_2}{\sqrt{x_1^2 + x_2^2}} = 0, \quad \lim_{x_1 \rightarrow 0} \lim_{x_2 \rightarrow 0} f(x_1, x_2) = 0.$$

Demak, berilgan funksiyaning takroriy limitlari mavjud va ular bir-biriga teng. ▶

Bu funksiyaning (karrali) limiti 0 ga teng bo'lishini ko'rgan edi.

**12.7-misol.** Ushbu

$$f(x_1, x_2) = \begin{cases} \frac{2x_1 - x_2}{x_1 + 3x_2}, & \text{agar } x_1 + 3x_2 \neq 0 \text{ bo'lsa} \\ 0, & \text{agar } x_1 + 3x_2 = 0 \text{ bo'lsa} \end{cases}$$

funksiyaning karrali va takroriy limitlari topilsin.

◀ Bu funksiyaning takroriy limitlari quyidagicha:

$$\lim_{x_1 \rightarrow 0} \frac{2x_1 - x_2}{x_1 + 3x_2} = -\frac{1}{3}, \quad \lim_{x_2 \rightarrow 0} \lim_{x_1 \rightarrow 0} \frac{2x_1 - x_2}{x_1 + 3x_2} = -\frac{1}{3},$$

$$\lim_{x_1 \rightarrow 0} \frac{2x_1 - x_2}{x_1 + 3x_2} = 2, \quad \lim_{x_1 \rightarrow 0} \lim_{x_2 \rightarrow 0} \frac{2x_1 - x_2}{x_1 + 3x_2} = 2$$

Demak, berilgan funksiyaning takroriy limitlari mavjud bo'lib, ularning biri  $-\frac{1}{3}$  ga, ikkinchisi esa 2 ga teng.

Biroq  $x = (x_1, x_2) \rightarrow (0, 0)$  da  $f(x_1, x_2)$  funksiyaning (karrali) limiti mavjud emas. Chunki  $(0, 0)$  nuqtaga intiluvchi ikkita  $x^{(n)} = \left(\frac{1}{n}, \frac{1}{n}\right) \rightarrow (0, 0)$ ,

$x^{(n)} = \left(\frac{5}{n}, \frac{4}{n}\right) \rightarrow 0$  ketma-ketliklar olinsa, ular uchun mos ravishda  $f\left(\frac{1}{n}, \frac{1}{n}\right) = \frac{1}{4} \rightarrow \frac{1}{4}$ .

$f\left(\frac{5}{n}, \frac{4}{n}\right) = \frac{6}{17} \rightarrow \frac{6}{17}$  bo'ladi. Bu esa  $(x_1, x_2) \rightarrow (0, 0)$  da berilgan funksiyaning (karrali) limiti mavjud emasligini bildiradi. ▶

**12.8-misol.** Ushbu

$$f(x_1, x_2) = \begin{cases} x_1 + x_2 \sin \frac{1}{x_1}, & \text{agar } x_1 \neq 0 \text{ bo'lsa} \\ 0, & \text{agar } x_1 = 0 \text{ bo'lsa} \end{cases}$$

funksiyaning karrali va takroriy limitlari topilsin.

◀ Bu funksiya uchun

$$\lim_{x_1 \rightarrow 0} f(x_1, x_2) = x_1, \quad \lim_{x_1 \rightarrow 0} \lim_{x_2 \rightarrow 0} f(x_1, x_2) = 0$$

bo'lib,  $\lim_{x_1 \rightarrow 0} \lim_{x_2 \rightarrow 0} f(x_1, x_2)$  mavjud emas. Demak, berilgan funksiyaning hitta takroriy limiti mavjud bo'lib, ikkinchi takroriy limiti esa mavjud emas. Ammo

$$|f(x_1, x_2) - 0| = \left| x_1 + x_2 \sin \frac{1}{x_1} \right| \leq |x_1| + |x_2| \quad (x_1 \neq 0)$$

munosabatdan  $(x_1, x_2) \rightarrow (0, 0)$  da  $f(x_1, x_2)$  funksiyaning (karrali) limiti mavjud va

$$\lim_{\substack{x_1 \rightarrow 0 \\ x_2 \rightarrow 0}} f(x_1, x_2) = 0$$

bo'lishi kelib chiqadi. ▶

**2-teorema.** Agar 1)  $(x_1, x_2) \rightarrow (x_1^0, x_2^0)$  da  $f(x_1, x_2)$  funksiyaning (karrali) limiti mavjud;

$$\lim_{\substack{x_1 \rightarrow x_1^0 \\ x_2 \rightarrow x_2^0}} f(x_1, x_2) = a,$$

2) har bir tayinlangan  $x_1$  da quyidagi

$$\lim_{x_2 \rightarrow x_2^0} f(x_1, x_2) = \varphi(x_1),$$

limit mavjud bo'lsa, u holda

$$\lim_{x_1 \rightarrow x_1^0} \lim_{x_2 \rightarrow x_2^0} f(x_1, x_2)$$

takroriy limit ham mavjud bo'lib,

$$\lim_{x_1 \rightarrow x_1^0} \lim_{x_2 \rightarrow x_2^0} f(x_1, x_2) = a$$

bo'ladi.

◀  $f(x_1, x_2)$  funksiya  $(x_1, x_2) \rightarrow (x_1^0, x_2^0)$  da karrali

$$\lim_{\substack{x_1 \rightarrow x_1^0 \\ x_2 \rightarrow x_2^0}} f(x_1, x_2) = a$$

limitga ega bo'lsin. Limitning ta'rifiga ko'rta,  $\forall \varepsilon > 0$  son olinganda ham, shunday  $\delta > 0$  topiladiki, ushu

$$\{(x_1, x_2) \in R^2 : |x_1 - x_1^0| < \delta, |x_2 - x_2^0| < \delta\} \subset M$$

to'plamning barcha  $(x_1, x_2)$  nuqtalari uchun

$$|f(x_1, x_2) - a| < \varepsilon \quad (12.15)$$

bo'ladi. Endi teoremaning 2) shartini e'tiborga olib  $x_1$  o'zgaruvchining  $|x_1 - x_1^0| < \delta$  tengsizlikni qanoatlaniradigan qiymatini tayinlab,  $x_2 \rightarrow x_2^0$  da (12.15) tengsizlikda limitga o'tib

$$|\varphi(x_1) - a| < \varepsilon$$

ni topamiz. Demak,  $\forall \varepsilon > 0$  son olinganda ham, shunday  $\delta > 0$  topiladiki,  $|x_1 - x_1^0| < \delta$  bo'lganda  $|\varphi(x_1) - a| \leq \varepsilon$  bo'ladi. Bu esa

$$\lim_{x_1 \rightarrow x_1^0} \varphi(x_1) = a$$

bo'lishini bildiradi. Keyingi munosabatdan

$$\lim_{x_1 \rightarrow x_1^0} \lim_{x_2 \rightarrow x_2^0} f(x_1, x_2) = a$$

bo'lishi kelib chiqadi. ►

Qo'yidagi teorema xuddi shunga o'xshash isbotlanadi.

**3-teorema.** Agar 1)  $(x_1, x_2) \rightarrow (x_1^0, x_2^0)$  da  $f(x_1, x_2)$  funksiyaning karrali limiti mavjud:

$$\lim_{\substack{x_1 \rightarrow x_1^0 \\ x_2 \rightarrow x_2^0}} f(x_1, x_2) = a$$

2) har bir tayinlangan  $x_2$  da quyidagi

$$\lim_{x_1 \rightarrow x_1^0} f(x_1, x_2) = \varphi(x_2)$$

limit mavjud bo'lsa, u holda

$$\lim_{x_2 \rightarrow x_2^0} \lim_{x_1 \rightarrow x_1^0} f(x_1, x_2)$$

takroriy limit ham mavjud bo'lib,

$$\lim_{x_2 \rightarrow x_2^0} \lim_{x_1 \rightarrow x_1^0} f(x_1, x_2) = a$$

bo'ladi.

**1-natija.** Agar bir vaqtida yuqoridagi 2- va 3- teoremlarning shartlari bajarilsa, u holda

$$\lim_{\substack{x_1 \rightarrow x_1^0 \\ x_2 \rightarrow x_2^0}} f(x_1, x_2) = \lim_{x_1 \rightarrow x_1^0} \lim_{x_2 \rightarrow x_2^0} f(x_1, x_2) = \lim_{x_2 \rightarrow x_2^0} \lim_{x_1 \rightarrow x_1^0} f(x_1, x_2)$$

bo'ladi.

**5. Koshi teoremasi (yaqinlashish prinsipi).** Endi ko'p o'zgaruvchili funksiya limitining mavjuddligi haqida umumiy teorema keltiramiz.

$R^n$  fazoda  $M$  to'plam berilgan bo'lib,  $a (a \in R^n)$  uning limit nuqtasi bo'lsin. Bu to'plamda  $f(x)$  funksiya berilgan.

**19-turif.** Agar  $\forall \varepsilon > 0$  son uchun shunday  $\delta > 0$  son topilsaki, ushbu  $0 < \rho(x, a) < \delta$ ,  $0 < \rho(x, a) < \delta$  tengsizliklarni qanoatlantiruvchi ixtiyoriy  $x$  va  $x$  ( $x \in M, x \in M$ ) nuqtalarda

$$|f(x) - f(a)| < \varepsilon$$

tengsizlik o'rinni bo'lsa,  $f(x)$  funksiya uchun  $a$  nuqtada Koshi sharti bajariladi deyiladi.

**4-teorema (Koshi teoremasi).**  $f(x)$  funksiya  $a$  nuqtada chekli limitiga ega bo'lishi uchun  $a$  nuqtada Koshi shartining bajarilishi zarur va yetarli.

◀ Zarurligi.  $x \rightarrow a$  da  $f(x)$  funksiya chekli limit

$$\lim_{x \rightarrow a} f(x) = a$$

ga ega bo'lsin. Ta'rifga binoan  $\forall \varepsilon > 0$  son olinganda ham  $\frac{\varepsilon}{2}$  ga ko'ra shunday  $\delta > 0$  topiladiki, ushbu  $0 < \rho(x, a) < \delta$  tengsizlikni qanoatlantiruvchi harcha  $x (x \in M)$  nuqtalarda

$$|f(x) - a| < \frac{\varepsilon}{2}.$$

jumladan  $0 < \rho(x, a) < \delta \Rightarrow |f(x) - a| < \frac{\varepsilon}{2}$  bo'ladi. Bu tengsizliklardan

$$|f(\bar{x}) - f(x)| \leq |f(\bar{x}) - a| + |f(x) - a| < \varepsilon$$

bo'lishi kelib chiqadi.

*Yetarlitigi.*  $f(x)$  funksiya uchun  $a$  nuqtada Koshi sharti bajarilsin, ya'ni  $\forall \varepsilon > 0$  son olinganda ham, shunday  $\delta > 0$  topiladiki, ushbu  $0 < \rho(x, a) < \delta$ ,  $0 < \rho(x, a) < \delta$  tengsizliklarni qanoatlantiruvchi ichtiyoriy  $x$  va  $x (\bar{x}, x \in M)$  nuqtalarda

$$|f(\bar{x}) - f(x)| < \varepsilon$$

bo'lsin. Bu holda  $f(x)$  funksiya  $x \rightarrow a$  da chekli limitiga ega bo'lishini ko'rsatamiz.

$a$  nuqta  $M$  to'plamning limit nuqtasi. Shuning uchun  $M$  to'plamning nuqtalaridan  $\{x^{(n)}\} (x^{(n)} \neq a, n = 1, 2, \dots)$  ketma-ketlik tuzish mumkinki, bunda

$$\lim_{n \rightarrow \infty} x^{(n)} = a$$

bo'ladi. Limitning ta'rifiga binoan, yuqorida keltirilgan  $\delta > 0$  ga ko'ra, shunday  $n_0 \in N$  topiladiki, harcha  $n > n_0$ ,  $\rho > n_0$  uchun  $0 < \rho(x^{(n)}, a) < \delta$ ,  $0 < \rho(x^{(n)}, a) < \delta$  bo'ladi. Bu tengsizliklarning bajarilishidan esa, shartga ko'ra:

$$|f(x^{(n)}) - f(x^{(n)})| < \varepsilon$$

bo'ladi. Demak,  $\{f(x^{(n)})\}$  fundamental ketma-ketlik. Binobarin,  $\{f(x^{(n)})\}$  ketma-ketlik yaqinlashuvchi.

Bu ketma-ketlikning limitini  $a$  bilan belgilaylik:

$$\lim_{n \rightarrow \infty} f(x^{(n)}) = a.$$

Endi  $M$  to'plamning nuqtalaridan tuzilgan va  $a$  nuqtaga intiluvchi ichtiyoriy  $\{x^{(n)}\}$  ketma-ketlik

$$\bar{x}^{(n)} \rightarrow a \quad (x^{(n)} \neq a, n = 1, 2, \dots)$$

olinganda ham mos  $\{f(\bar{x}^{(n)})\}$  ketma-ketlik (u yuqorida ko'rsatganimizga binoan yaqinlashuvchi bo'ladi) ham o'sha  $a$  ga intilishini ko'rsatamiz.

Faraz qilaylik  $\bar{x}^{(n)} \rightarrow a$  ( $x^{(n)} \neq a, n = 1, 2, \dots$ ) bo'lganda

$$f(\bar{x}^{(n)}) = a^1$$

bo'lsin.  $\{x^{(n)}\}, \{\bar{x}^{(n)}\}$  ketma-ketlik hadlaridan ushhu

$$x^{(1)}, x^{-(1)}, x^{(2)}, x^{-(2)}, \dots, x^{(n)}, x^{-(n)}$$

ketma-ketlik tuzaylik. Ravshanki, bu ketma-ketlik  $a (a \in R^n)$  ga intiladi. U holda  $f(x^{(1)}) f(x^{-(1)}) f(x^{(2)}) f(x^{-(2)}) \dots f(x^{(n)}) f(x^{-(n)})$  (12.16)

ketma-ketlik chekli limitiga ega. Uni  $a^*$  orqali belgilaylik. Agar  $\{f(x^{(n)})\}$  va  $\{f(x^{(n)})\}$  ketma-ketliklarning har biri (12.16) ketma-ketlikning qismiy ketma-ketliklari ekanligini e'tiborga olsak, u holda

$$f(x^{(n)}) \rightarrow a^* \quad f(x^{(n)}) \rightarrow a^*$$

bo'lishini topamiz. Demak,

$$a^* = a = a'$$

Shunday qilib,  $f(x)$  funksiya uchun  $a$  nuqtada Koshi shartining bajariishidan  $M$  to'plam nuqtalaridan tuzilgan va  $a$  ga intiluvchi har qanday  $(x^{(n)})$  ( $x^{(n)} \neq a, n=1, 2, \dots$ ) ketma-ketlik olinganda mos ketma-ketlik bitta songa intilishini topdik. Bu esa funksiya limitining Geyne ta'rifiga ko'ra  $f(x)$  funksiya  $a$  nuqtada chekli limitga ega bo'lishini bildiradi. ►

**3-eslatma.** Koshi sharti va Koshi teoremasi  $x \rightarrow \infty$  da ham yuqoridagiga o'xhash ifodalanadi va isbot etiladi.

#### 4-§. Ko'p o'zgaruvchili funksiyaning uzluksizligi

**1". Funksiya uzluksizligi ta'rif.**  $M \subset R^n$  to'plamda  $f(x) = f(x_1, x_2, \dots, x_m)$  funksiya berilgan bo'lib,  $a \in M$  ( $a = (a_1, a_2, \dots, a_m)$ ) nuqta esa  $M$  to'plamning limit nuqtasi bo'lsin.

**19-ta'rif.** Agar  $x \rightarrow a$  da  $f(x)$  funksiyaning limiti mavjud bo'lib,

$$\lim_{x \rightarrow a} f(x) = f(a)$$

$$\left\{ \begin{array}{l} \lim_{x_1 \rightarrow a_1} f(x_1, x_2, \dots, x_m) = f(a_1, a_2, \dots, a_m) \\ \lim_{x_2 \rightarrow a_2} \\ \dots \\ \lim_{x_m \rightarrow a_m} \end{array} \right\} \quad (12.17)$$

bo'lsa,  $f(x)$  funksiya  $a$  nuqtada uzluksiz deb ataladi.

**20-ta'rif. (Geyne ta'rif).** Agar  $M \subset R^n$  to'plamning nuqtalaridan tuzilgan,  $a (a \in M)$  ga intiluvchi har qanday  $\{x^{(n)}\}$  ketma-ketlik olinganda ham, mos  $\{f(x^{(n)})\}$  ketma-ketlik hamma vaqt  $f(a)$  ga intilsa,  $f(x)$  funksiya  $a$  nuqtada uzluksiz deb ataladi.

**21-ta'rif. (Koshi ta'rif).** Agar  $\forall \varepsilon > 0$  son uchun shunday  $\delta > 0$  topilsaki. ushbu  $\rho(x, a) < \delta$  tengsizlikni qanoatlantiruvchi barcha  $x \in M$  nuqlarda

$$|f(x) - f(a)| < \varepsilon$$

tengsizlik bajarilsa,  $f(x)$  funksiya  $a$  nuqtada uzluksiz deb ataladi.

Atrof tushunchasi yordamida funksiyaning uzluksizligini quyidagicha ham ta'riflash mumkin.

**22-ta'rif.** Agar  $\forall \varepsilon > 0$  son uchun shunday  $\delta > 0$  topilsaki, barcha  $x \in U_\delta(a) \cap M$  nuqtalarda  $f(x)$  funksiyaning qiymatlari  $f(x) \in U_\varepsilon(f(a))$ , ya'ni  $x \in U_\delta(a) \cap M \Rightarrow f(x) \in U_\varepsilon(f(a))$

bo'lsa,  $f(x)$  funksiya  $a$  nuqtada uzlusiz deb ataladi.

$f(x) = f(x_1, x_2, \dots, x_m)$  funksiyaning  $a = (a_1, a_2, \dots, a_m)$  nuqtada uzlusizligini funksiya orttirmasi yordamida ham ta'riflash mumkin.

Funksiya argumentlarining orttirmalari

$$\Delta x_1 = x_1 - a_1, \Delta x_2 = x_2 - a_2, \dots, \Delta x_m = x_m - a_m$$

ga mos ushbu

$$\begin{aligned} f(x) - f(a) &= f(x_1, x_2, \dots, x_m) - f(a_1, a_2, \dots, a_m) = \\ &= f(a_1 + \Delta x_1, a_2 + \Delta x_2, \dots, a_m + \Delta x_m) - f(a_1, a_2, \dots, a_m) \end{aligned}$$

ayirma  $f(x)$  funksiyaning  $a$  nuqtadagi to'liq orttirmasi deb ataladi va  $\Delta f$  yoki  $\Delta f(a)$  kabi belgilanadi:

$$\Delta f(a) = f(a_1 + \Delta x_1, a_2 + \Delta x_2, \dots, a_m + \Delta x_m) - f(a_1, a_2, \dots, a_m).$$

Quyidagi

$$\begin{aligned} &f(a_1 + \Delta x_1, a_2, \dots, a_m) - f(a_1, a_2, \dots, a_m), \\ &f(a_1, a_2 + \Delta x_2, a_3, \dots, a_m) - f(a_1, a_2, \dots, a_m). \end{aligned}$$

$$f(a_1, a_2, \dots, a_{m-1}, a_m + \Delta x_m) - f(a_1, a_2, \dots, a_m)$$

ayilmalar  $f(x)$  funksiyaning  $a$  nuqtadagi xususiy orttirmalari deyiladi va ular mos ravishda  $\Delta_{x_1} f, \Delta_{x_2} f, \dots, \Delta_{x_m} f$  kabi belgilanadi.

Yuqoridagi (12.17) limit munosabatdan topamiz:

$$\lim_{x \rightarrow a} f(x) = f(a) \Rightarrow \lim_{x \rightarrow a} [f(x) - f(a)] = 0.$$

Natijada (12.17) tenglik quyidagi

$$\lim_{x \rightarrow a} \Delta f(a) = 0 \text{ ya'ni } \lim_{\substack{\Delta x_1 \rightarrow 0 \\ \Delta x_m \rightarrow 0}} \Delta f(a) = 0$$

ko'rinishga keladi. Demak,  $f(x)$  funksiyaning  $a$  nuqtadagi uzlusizligi

$$\lim_{x \rightarrow a} \Delta f(a) = 0 \quad \left( \begin{array}{l} \lim_{\Delta x_1 \rightarrow 0} \Delta f(a) = 0 \\ \dots \\ \lim_{\Delta x_m \rightarrow 0} \Delta f(a) = 0 \end{array} \right)$$

kabi ham ta'riflanishi mumkin ekan.

**23-ta'rif.** Agar  $f(x)$  funksiya  $M(M \subset R^m)$  to'plamning har bir nuqtasida uzlusiz bo'lsa, funksiya shu  $M$  to'plamda uzlusiz deb ataladi.

**12.9-misol.** Ushbu

$$f(x_1, x_2) = \begin{cases} \frac{x_1 + x_2}{\sqrt{x_1^2 + x_2^2}}, & \text{agar } x_1^2 + x_2^2 \neq 0 \\ 0, & \text{agar } x_1^2 + x_2^2 = 0 \end{cases}$$

funksiya uzlusizlikka tekshirilsin.

◀ Ravshanki, bu funksiya  $R^2$  da aniqlangan. Aytaylik  $(x_1^0, x_2^0) \neq (0, 0)$  bo'lsin. Limit xossalardan foydalaniib topamiz:

$$\lim_{\substack{x_1 \rightarrow x_1^0 \\ x_2 \rightarrow x_2^0}} f(x_1, x_2) = \lim_{\substack{x_1 \rightarrow x_1^0 \\ x_2 \rightarrow x_2^0}} \frac{x_1 + x_2}{\sqrt{x_1^2 + x_2^2}} = \lim_{\substack{x_1 \rightarrow x_1^0 \\ x_2 \rightarrow x_2^0}} \sqrt{x_1^2 + x_2^2} \cdot \frac{x_1^0 + x_2^0}{\sqrt{x_1^0 + x_2^0}} = \frac{x_1^0 + x_2^0}{\sqrt{x_1^0 + x_2^0}} = f(x_1^0, x_2^0).$$

$(x_1^0, x_2^0) = (0, 0)$  bo'lgan holda

$$\lim_{\substack{x_1 \rightarrow 0 \\ x_2 \rightarrow 0}} f(x_1, x_2) = 0 = f(0, 0)$$

bo'ladi (qaralsin, 12.4-misol).

Demak, berilgan funksiya  $R^2$  da uzlusiz.

24-ta'rif. Agar  $x \rightarrow a$  da  $f(x)$  funksiyaning limiti mavjud bo'lmasa, yoki

$$\lim_{x \rightarrow \infty} f(x) = \infty,$$

yoki funksiyaning limiti mavjud, chekli bo'lib,

$$\lim_{x \rightarrow \infty} f(x) = a \neq f(a)$$

bo'lsa, funksiya  $a$  nuqtada uzilishga ega deb ataladi.

12.10-misol. Ushbu

$$f(x_1, x_2) = \begin{cases} x_1^2 + x_2^2, & \text{agar } (x_1, x_2) \neq (0, 0) \text{ bo'lsa,} \\ 1, & \text{agar } (x_1, x_2) = (0, 0) \text{ bo'lsa} \end{cases}$$

funksiya uzlusizlikka tekshirilsin.

◀ Bu funksiya  $R^2$  to'plamda berilgan bo'lib, uning  $(0, 0)$  nuqtadagi limiti

$$\lim_{\substack{x_1 \rightarrow 0 \\ x_2 \rightarrow 0}} f(x_1, x_2) = 0 \neq f(0, 0) = 1$$

bo'ladi. Demak, berilgan funksiya  $(0, 0)$  nuqtada uzilishga ega, qolgan barcha nuqtalarda uzlusiz. ►

12.11-misol. Quyidagi

$$f(x_1, x_2) = \begin{cases} \frac{1}{x_1^2 + x_2^2 - 1}, & \text{agar } x_1^2 + x_2^2 \neq 1 \text{ bo'lsa,} \\ 0, & \text{agar } x_1^2 + x_2^2 = 1 \text{ bo'lsa} \end{cases}$$

funksiya uzlusizlikka tekshirilsin.

◀ Bu funksiya  $\{(x_1, x_2) \in R^2 : x_1^2 + x_2^2 = 1\}$  to'plamning har bir nuqtasida uzilishga ega bo'ladi, chunki  $(x_1, x_2) \rightarrow (x_1^0, x_2^0)$   $(x_1^{00} + x_2^{00} = 1)$  da  $f(x_1, x_2)$  funksiya ning chekli limiti mavjud emas. ►

## 2<sup>н</sup>. Uzluksiz funksiyalar ustida arifmetik amallar. Murakkab funksiyaning uzluksizligi.

**5-teorema** Agar  $f_1(x)$  va  $f_2(x)$  funksiyalarning har biri  $M \subset R^n$  to'plamda berilgan bo'lib, ular  $a \in M$  nuqtada uzluksiz bo'lsa,

$$f_1(x) \pm f_2(x), \quad f_1(x) \cdot f_2(x) \text{ hamda } \frac{f_1(x)}{f_2(x)} \quad (f_2(x) \neq 0)$$

funksiyalar ham shu nuqtada uzluksiz bo'ladi.

◀ Bu teoremaning isboti, limitga ega bo'lgan funksiyalar ustida arifmetik amallar haqidagi ma'lumotlardan (ushbu bobning 3-§ dagi 5, 6 va 7- xossalari) bevosita kelib chiqadi. ▶

Faraz qilaylik,  $M \subset R^n$  to'plamda  $y = f(x) = f(x_1, x_2, \dots, x_m)$  funksiya berilgan bo'lib,  $x_1, x_2, \dots, x_m$  larning har bir  $T \subset R^k$  ( $k \in N$ ) to'plamda berilgan funksiyalar bo'lsin:

$$x_1 = \varphi_1(t) = \varphi_1(t_1, t_2, \dots, t_k),$$

$$x_2 = \varphi_2(t) = \varphi_2(t_1, t_2, \dots, t_k),$$

$$\dots \dots \dots$$

$$x_m = \varphi_m(t) = \varphi_m(t_1, t_2, \dots, t_k)$$

Biz  $t = (t_1, t_2, \dots, t_k) \in T$  bo'lganda unga mos  $x = (x_1, x_2, \dots, x_m) \in M$  deb qaraymiz. Bu funksiyalar yordamida

$y = f(\varphi_1(t_1, t_2, \dots, t_k), \varphi_2(t_1, t_2, \dots, t_k), \dots, \varphi_m(t_1, t_2, \dots, t_k)) = \Phi(t_1, t_2, \dots, t_k) = \Phi(t)$  murakkab funksiyani tuzamiz.

**6-teorema** Agar  $\varphi_i(t) = \varphi_i(t_1, t_2, \dots, t_k)$  ( $i = 1, 2, \dots, m$ ) funksiyalarning har bir  $t^0 = (t_1^0, t_2^0, \dots, t_m^0)$  nuqtada uzluksiz bo'lib,  $f(x) = f(x_1, x_2, \dots, x_m)$  funksiya esa  $t^0 = (t_1^0, t_2^0, \dots, t_k^0)$  nuqtaga mos

$$x_1^0 = (x_1^0, x_2^0, \dots, x_m^0) \quad (x_1^0 = \varphi_1(t_1^0, t_2^0, \dots, t_k^0), \quad x_2^0 = \varphi_2(t_1^0, t_2^0, \dots, t_k^0), \quad \dots, \quad x_m^0 = \varphi_m(t_1^0, t_2^0, \dots, t_k^0))$$

nuqtada uzluksiz bo'lsa,  $y = \Phi(t) = \Phi(t_1, t_2, \dots, t_k)$  murakkab funksiya  $t^0 = (t_1^0, t_2^0, \dots, t_k^0)$  nuqtada uzluksiz bo'ladi.

◀  $x_i = \varphi_i(t) = \varphi_i(t_1, t_2, \dots, t_k)$  ( $i = 1, 2, \dots, m$ ) funksiya  $t^0 = (t_1^0, t_2^0, \dots, t_k^0)$  nuqtada uzluksiz bo'lsin.

$T \subset R^k$  to'plamda  $t^0 = (t_1^0, t_2^0, \dots, t_k^0)$  nuqtaga intiluvchi ixtiyoriy

$$\left\{ t^{(n)} \right\} = \left\{ (t_1^{(n)}, t_2^{(n)}, \dots, t_k^{(n)}) \right\} \quad (n = 1, 2, \dots)$$

ketma-ketlikni olaylik. U holda uzluksizlikning Geyne ta'rifiga ko'ra

$$\left. \begin{array}{l} t_1^{(n)} \rightarrow t_1^0 \\ t_2^{(n)} \rightarrow t_2^0 \\ t_m^{(n)} \rightarrow t_m^0 \end{array} \right\} \Rightarrow \begin{array}{l} x_1^{(n)} = \varphi_1(t_1^{(n)}, t_2^{(n)}, \dots, t_k^{(n)}) \rightarrow \varphi_1(t_1^0, t_2^0, \dots, t_k^0) = x_1^0 \\ x_2^{(n)} = \varphi_2(t_1^{(n)}, t_2^{(n)}, \dots, t_k^{(n)}) \rightarrow \varphi_2(t_1^0, t_2^0, \dots, t_k^0) = x_2^0, \\ \dots \\ x_m^{(n)} = \varphi_m(t_1^{(n)}, t_2^{(n)}, \dots, t_k^{(n)}) \rightarrow \varphi_m(t_1^0, t_2^0, \dots, t_k^0) = x_m^0 \end{array}$$

bo'ladi.

$y = f(x_1, x_2, \dots, x_m)$  funksiya  $(x_1^0, x_2^0, \dots, x_m^0)$  nuqtada uzlusiz. U holda yana Geyne ta'risiga ko'ra

$$\left. \begin{array}{l} x_1^{(n)} \rightarrow x_1^0 \\ x_2^{(n)} \rightarrow x_2^0 \\ \dots \\ x_k^{(n)} \rightarrow x_k^0 \end{array} \right\} \Rightarrow f(x_1^{(n)}, x_2^{(n)}, \dots, x_m^{(n)}) \rightarrow f(x_1^0, x_2^0, \dots, x_m^0)$$

bo'ladi. Demak,  $t_1^{(n)} \rightarrow t_1^0, t_2^{(n)} \rightarrow t_2^0, \dots, t_k^{(n)} \rightarrow t_k^0$  da

$$f(\varphi_1(t_1^{(n)}, t_2^{(n)}, \dots, t_k^{(n)}), \varphi_2(t_1^{(n)}, t_2^{(n)}, \dots, t_k^{(n)}), \dots, \varphi_m(t_1^{(n)}, t_2^{(n)}, \dots, t_k^{(n)})) \rightarrow \\ \rightarrow f(\varphi_1(t_1^0, t_2^0, \dots, t_k^0), \varphi_2(t_1^0, t_2^0, \dots, t_k^0), \dots, \varphi_m(t_1^0, t_2^0, \dots, t_k^0))$$

Bu esa  $y = f(\varphi_1(t_1, t_2, \dots, t_k), \varphi_2(t_1, t_2, \dots, t_k), \dots, \varphi_m(t_1, t_2, \dots, t_k)) = \Phi(t_1, t_2, \dots, t_k)$  funksiyaning  $t^0 = (t_1^0, t_2^0, \dots, t_k^0)$  nuqtada uzlusiz ekanligini bildiradi. ▶

### 5-8. Uzlusiz funksiyalarning xossatari

Biz quyida ko'p o'zgaruvchili uzlusiz funksiyalarning xossalarini keltiramiz. Bunda bir o'zgaruvchili uzlusiz funksiyalarning xossalarini to'g'risida ma'lumotlardan to'la foydalana boramiz.

Ko'p o'zgaruvchili uzlusiz funksiyalar ham bir o'zgaruvchili uzlusiz funksiyalarning xossalarini kabi xossalarga ega.

1). *Nuqtada uzlusiz bo'lgan funksiyalarning xossatari (lokal xossatari).*  $f(x)$  funksiya  $M (M \subset R^n)$  to'plamda berilgan bo'lib,  $x^0 \in M$  nuqtada uzlusiz bo'lisin. Bunday  $f(x)$  funksiyaning  $x^0$  nuqtanining yetarli kichik atrofi  $U_\delta(x^0) \subset M$  dagi xossalarni (lokal xossalarni) o'rganimiz.

1) Agar  $f(x)$  funksiya  $x^0 \in M$  nuqtada uzlusiz bo'lsa, u holda  $x^0$  nuqtanining yetarli kichik atrofidagi funksiya chegaralanganligini chegaralangan bo'ladi.

◀ Funksiya uzlusizligi ta'risiga ko'ra

$$\lim_{x \rightarrow x^0} f(x) = f(x^0)$$

bo'lib, undan  $f(x)$  funksiyani  $x^0$  nuqtada chekli limitga ega ekanligi kelib chiqadi. Chekli limitga ega bo'lgan funksiyaning xossalardan esa,  $f(x)$  funksiyani  $x^0$  nuqtanining yetarli kichik atrofida chegaralanganligini topamiz. ▶

2) Agar  $f(x)$  funksiya  $x^0$  nuqtada uzlusiz bo'lib,  $f(x^0) > 0$  ( $f(x^0) < 0$ ) bo'lsa,  $x^0$  nuqtanining yetarli kichik atrofidagi  $x$  nuqtalarda  $f(x) > 0$  ( $f(x) < 0$ ) bo'ladi.

◀ Funksiya  $x^0$  nuqtada uzlusizligi ta'risiga ko'ra,  $\forall \varepsilon > 0$  olinganda ham shunday  $\delta > 0$  topiladi, barcha  $x \in U_\delta(x^0) \cap M$  nuqtalar uchun

$$f(x^0) - \varepsilon < f(x) < f(x^0) + \varepsilon$$

bo'ladi.

Bu erda  $\varepsilon = f(x^0) > 0$  (agar  $f(x^0) < 0$  bo'lsa,  $\varepsilon = -f(x^0)$ ) deb olsak, fikrimizning tasdigiga ega bo'lazim. ►

Demak,  $f(x)$  funksiya  $x^0$  nuqtada uzlusiz va  $f(x^0) \neq 0$  bo'lsa,  $x^0$  nuqtaning yetarli kichik atrofidagi  $x$  nuqtalarda funksiya qiymatlarining ishorasi  $f(x)$  ning ishorasi bilan bir xil bo'lar ekan:

$$\operatorname{sign} f(x) = \operatorname{sign} f(x^0).$$

3) Agar  $f(x)$  funksiya  $x^0$  nuqtada uzlusiz bo'lsa,  $x^0$  nuqtaning yetarli kichik atrofidagi  $x' \in M$ ,  $x'' \in M$  nuqtalar uchun

$$|f(x') - f(x'')| < \varepsilon$$

tengsizlik o'rini bo'ladi.

◀  $f(x)$  funksiyaning  $x^0$  nuqtada uzlusizligiga asosan,  $\forall \varepsilon > 0$  olinganda ham  $\frac{\varepsilon}{2}$  ga ko'ra shunday  $\delta > 0$  topiladiki, barcha  $x \in U_\delta(x^0)$  nuqtalar uchun

$$|f(x) - f(x^0)| < \frac{\varepsilon}{2}$$

bo'ladi. Jumladan,  $x' \in U_\delta(x^0)$ ,  $x'' \in U_\delta(x^0)$  nuqtalar uchun ham

$$|f(x') - f(x^0)| < \frac{\varepsilon}{2}, |f(x'') - f(x^0)| < \frac{\varepsilon}{2}$$

tengsizliklar o'rini bo'ladi. Keyingi tengsizliklardan esa  $|f(x') - f(x'')| < \varepsilon$  bo'lishi kelib chiqadi. ►

2'. To'plamda uzlusiz bo'lgan funksiyalarning xossalari (global xossalari). Endi  $M \subset R^n$  to'plamda uzlusiz bo'lgan funksiyalarning xossalari (global xossalari), aniqrog'i  $f(x)$  funksiya qiymatlaridan iborat  $\{f(x); x \in M\}$  to'plamning xossalari o'rGANAMIZ.

#### 17-teorema (Boltsano-Koshining birinchi teoremasi).

$f(x) = f(x_1, x_2, \dots, x_m)$  funksiya bog'lamli  $M \subset R^n$  to'plamda uzlusiz bo'lsin. Agar bu funksiya to'plamning ikkita  $a = (a_1, a_2, \dots, a_m)$  va  $b = (b_1, b_2, \dots, b_m)$  nuqtasida har xil ishorali qiymatlarga ega bo'lsa, u holda shunday  $c = (c_1, c_2, \dots, c_m) \in M$  nuqta topiladiki, bu nuqtada funksiya nolga aylanadi:

$$f(c) = f(c_1, c_2, \dots, c_m) = 0.$$

◀ Aniqlik uchun  $f(a) = f(a_1, a_2, \dots, a_m) < 0$ ,  $f(b) = f(b_1, b_2, \dots, b_m) > 0$  bo'lsin.  $M \subset R^n$  bog'lamli to'plani bo'lgani uchun bu  $a$  va  $b$  nuqtalarni birlashtiruvchi va  $M$  to'plamda yotuvchi siniq chiziq topiladi. Bu siniq chiziq uchlari bo'lgan nuqtalarda  $f(x)$  funksiyaning qiymatlarini hisoblab boramiz. Bunda ikki xol yuz beradi:

1) Siniq chiziq uchlarning birida  $f(x)$  funksiya nolga aylanadi. Bu holda siniq chiziqning shu uchini teoremadagi  $c$  nuqta deb olinsa,  $f(c) = 0$  bo'lib, teorema isbotlanadi.

2) Siniq chiziq uchlarida  $f(x)$  funksiya nolga aylanmaydi. Bu holda siniq chiziqning shunday kesmasi topiladiki, uning uchlarida  $f(x)$  funksiyaning qiymatlari har xil ishorali bo'ladi. Siniq chiziqning xuddi shu uchlarining birini  $a' = (a'_1, a'_2, \dots, a'_m)$  bilan, ikkinchi uchini esa  $b' = (b'_1, b'_2, \dots, b'_m)$  bilan belgilasak, unda

$$f(a') = f(a'_1, a'_2, \dots, a'_m) < 0,$$

$$f(b') = f(b'_1, b'_2, \dots, b'_m) > 0$$

bo'ladi. Siniq chiziqning bu kesmasining tenglamasi ushbu

$$x_1 = a'_1 + t(b'_1 - a'_1),$$

$$x_2 = a'_2 + t(b'_2 - a'_2),$$

$$\dots$$

$$x_m = a'_m + t(b'_m - a'_m)$$

$(0 \leq t \leq 1)$  ko'rinishda yoziladi.

Agar o'zgaruvchi  $x = (x_1, x_2, \dots, x_m) \in M$  nuqtani siniq chiziqning shu kesmasi bo'yichagina o'zgaradi deh olinadigan bo'lsa, u holda  $f(x) = f(x_1, x_2, \dots, x_m)$  ko'p o'zgaruvchili funksiya quyidagicha

$$F(t) = f(a'_1 + t(b'_1 - a'_1), a'_2 + t(b'_2 - a'_2), \dots, a'_m + t(b'_m - a'_m))$$

bitta  $t$  o'zgaruvchining murakkab funksiyasi bo'lib qoladi. Murakkab funksiyaning uzluksizligi haqidagi teorema ko'ra  $F(t)$  funksiya  $[0, 1]$  segmentda uzluksizdir. Ikkinchisi tomonidan  $t=0$  va  $t=1$  da bu funksiya turli ishorali qiymatlarga ega:

$$F(0) = f(a'_1, a'_2, \dots, a'_m) < 0,$$

$$F(1) = f(b'_1, b'_2, \dots, b'_m) > 0.$$

Shunday qilib,  $F(t)$  funksiya  $[0, 1]$  segmentda uzluksiz va shu segmentning chetki nuqtalarida har xil ishorali qiymatlarga ega. U holda 1-qism, 5-bob, 6-§ dagi 5-teorema ko'ra,  $(0, 1)$  intervalda shunday  $t_0$  nuqta topiladiki,

$$F(t_0) = 0$$

bo'ladi. Demak,

$$F(t_0) = f(a'_1 + t_0(b'_1 - a'_1), a'_2 + t_0(b'_2 - a'_2), \dots, a'_m + t_0(b'_m - a'_m)) = 0.$$

Agar

$$c_1 = a'_1 + t_0(b'_1 - a'_1),$$

$$c_2 = a'_2 + t_0(b'_2 - a'_2),$$

$$\dots$$

$$c_m = a'_m + t_0(b'_m - a'_m)$$

deb olsak, ravshanki,  $c = (c_1, c_2, \dots, c_m) \in M$  va  $f(c) = f(c_1, c_2, \dots, c_m) = 0$  bo'ladi. ▶

Quyidagi teorema ham shunga o'xshash isbotlanadi.

**18-teorema (Boltsano-Koshining ikkinchi teoremasi).**  $f(x) = f(x_1, x_2, \dots, x_m)$  funksiya bog'lamli  $M \subset R^m$  to'plamida uzluksiz bo'lib,  $M$  to'plamining ikkita  $a = (a_1, a_2, \dots, a_m)$  va  $b = (b_1, b_2, \dots, b_m)$  nuqtasida  $f(a) = A$ ,  $f(b) = B$ , ( $A \neq B$ )

qiy mattarga ega bo'lsin.  $A$  va  $V$  orasida har qanday  $C$  son olinsa ham  $M$  to'plamda shunday  $c = (c_1, c_2, \dots, c_m)$  nuqta topiladi.

$$f(c) = f(c_1, c_2, \dots, c_m) = C$$

bo'ladi.

**19-teorema (Veyershtrassning birinchi teoremasi).** Agar  $f(x)$  funksiya chegaralangan yopiq  $M \subset R^n$  to'plamda uzlusiz bo'lsa, funksiya shu  $M$  to'plamda chegaralangan bo'ladi.

◀ Teskarisini faraz qilaylik, ya'ni  $f(x)$  funksiya chegaralangan yopiq  $M$  to'plamda uzlusiz bo'lsa ham, u shu to'plamda chegaralanmagan bo'lsin. U holda  $\forall n \in N$  uchun shunday  $x^{(n)} \in M$  nuqta topiladi,

$$|f(x^{(n)})| > n \quad (12.18)$$

bo'ladi. Bunday nuqtalardan  $\{x^{(n)}\}$  ( $x^{(n)} \in M$ ,  $n = 1, 2, \dots$ ) ketma-ketlik tuzamiz. Modomiki,  $M$  to'plam chegaralangan ekan. unda  $\{x^{(n)}\}$  ketma-ketlik ham chegaralangandir. Boltsano-Veyershtrass teoremasiga (ushbu bobning 2-§ iga) ko'tra  $\{x^{(n)}\}$  ketma-ketlikdan yaqinlashuvchi bo'lgan  $\{x^{(n)}\}$  qismiy ketma-ketlik ajratish mumkin:  $\{x^{(n_k)}\} \rightarrow x^0$  ( $k \rightarrow \infty$ ).  $M$  yopiq to'plam bo'lgani uchun  $x^0 \in M$  bo'ladi.  $f(x)$  funksiyaning  $M$  to'plamda uzlusiz ekanligidan esa

$$f(x^{(n_k)}) \rightarrow f(x^0)$$

bo'lishi kelib chiqadi. Natijada bir tomonidan (12.18) munosabatga ko'ta

$$|f(x^{(n_k)})| > n_k$$

ya'ni  $f(x^{(n_k)}) \rightarrow \infty$  ( $k \rightarrow \infty$ ) bo'lsa, ikkinchi tomonidan  $f(x^{(n_k)}) \rightarrow f(x^0)$  bo'lib qoldi. Bunday ziddiyat  $f(x)$  funksiyani  $M$  to'plamda chegaralanmagan deb olinishi oqibatida kelib chiqadi. Demak,  $f(x)$  funksiya  $M$  to'plamda chegaralangan. ▶

**20-teorema (Veyershtrassning ikkinchi teoremasi).** Agar  $f(x)$  funksiya chegaralangan yopiq  $M \subset R^n$  to'plamda uzlusiz bo'lsa, u shu to'plamda o'zining aniq yuqori hamda aniq quyi chegaralariga erishadi.

Bu teoremaning isboti 1-qism, 5-bob, 6-§ dagi 8-teoremaning isboti kabitidir. Uni isbotlashni o'quvchiga havola etamiz.

### 6-§. Ko'p o'zgaruvchili funksiyaning tekis uzlusizligi. Kantor teoremasi

$f(x)$  funksiya  $M \subset R^n$  to'plamda berilgan bo'lsin.

**24-ta'rif.** Agar  $\forall \varepsilon > 0$  son uchun  $\delta > 0$  topilsaki,  $M$  to'plamning  $\rho(x', x'') < \delta$  tengsizlikni qanoatlantiruvchi ixtiyoriy  $x'$  va  $x''$  ( $x' \in M$ ,  $x'' \in M$ ) nuqtalarida

$$|f(x') - f(x'')| < \varepsilon$$

tengsizlik hajarilsa,  $f(x)$  funksiya  $M$  to'plamda tekis uzlusiz funksiya deb ataladi.

Funksiyaning tekis uzlusizligi ta'rifidagi  $\delta > 0$  son  $\varepsilon > 0$  gagina bog'liq bo'ladi. Ravshanki, agar  $f(x)$  funksiya  $M \subset R^n$  to'plamda tekis uzlusiz bo'lsa, u shu to'plamda uzlusiz bo'ladi.

### 12.12-misol. Ushbu

$$f(x_1, x_2) = x_1^2 + x_2^2$$

funksiyaning  $D = \{(x_1, x_2) \in R^2 : x_1^2 + x_2^2 \leq 1\}$  to'plamda tekis uzlusiz bo'lishi ko'rsatilsin.

◀  $\forall \varepsilon > 0$  sonni olib, unga ko'ra topiladigan  $\delta > 0$  sonni  $\delta < \frac{\varepsilon}{4}$  deb olsak. u holda

$$\rho(x', x'') = \rho((x'_1, x'_2), (x''_1, x''_2)) = \sqrt{(x''_1 - x'_1)^2 + (x''_2 - x'_2)^2} < \delta$$

tengsizlikni qanoatlantiruvchi  $\forall (x'_1, x'_2) \in D, \forall (x''_1, x''_2) \in D$  nuqtalar uchun

$$\begin{aligned} |f(x'_1, x'_2) - f(x''_1, x''_2)| &= |(x'_1)^2 + (x'_2)^2 - ((x''_1)^2 + (x''_2)^2)| = \\ &= (x'_1 - x''_1)(x'_1 + x''_1) + (x'_2 - x''_2)(x'_2 + x''_2) \leq 2\sqrt{(x'_1 - x''_1)^2 + (x'_2 - x''_2)^2} + \\ &+ 2\sqrt{(x'_1 - x''_1)^2 + (x'_2 - x''_2)^2} = 4\delta < \varepsilon \end{aligned}$$

bo'ladi.

Demak, berilgan funksiya  $D \subset R^2$  to'plamda tekis uzlusiz. ▶

**II-teorema. (Kantor teoremasi).** Agar  $f(x)$  funksiya chegaralangan yopiq  $M (M \subset R^n)$  to'plamda uzlusiz bo'lsa, funksiya shu to'plamda tekis uzlusiz bo'ladi.

◀ Teskarisini faraz qilaylik, ya'ni  $f(x)$  funksiya chegaralangan yopiq  $M$  to'plamda uzlusiz bo'lisinu, ammo tekis uzlusizlik ta'rifidagi shart bajarilmasin. Bu holda biror  $\varepsilon > 0$  son va ixtiyoriy  $\delta > 0$  son uchun  $M$  to'plamda  $\rho(x', x'') < \delta$  tengsizlikni qanoatlantiruvchi shunday  $x'$  va  $x''$  ( $x' \in M, x'' \in M$ ) nuqtalari topiladiki.

$$|f(x') - f(x'')| \geq \varepsilon$$

bo'ladi.

Nolga intiluvchi musbat sonlar ketma-ketligi  $\delta_1, \delta_2, \dots, \delta_n$ , ni olaylik:

$$\delta_n \rightarrow 0 \quad (\delta_n > 0, n = 1, 2, \dots). \quad (12.19)$$

Farazimizga ko'ra, yuqorida  $\varepsilon > 0$  son va ixtiyoriy  $\delta_n > 0$  ( $n = 1, 2, \dots$ ) uchun  $M$  to'plamda shunday  $a^{(n)}$  va  $a'^{(n)}$  ( $n = 1, 2, \dots$ ) nuqtalar topiladiki,

$$\rho(a^{(1)}, a'^{(1)}) < \delta_1 \text{ va } |f(a^{(1)}) - f(a'^{(1)})| \geq \varepsilon$$

$$\rho(a^{(2)}, a'^{(2)}) < \delta_2 \text{ va } |f(a^{(2)}) - f(a'^{(2)})| \geq \varepsilon$$

$$\rho(a^{(n)}, a'^{(n)}) < \delta_n \text{ va } |f(a^{(n)}) - f(a'^{(n)})| \geq \varepsilon$$

bo'ladi.

Modomiki,  $M$  - chegaralangan to'plam va  $a^{(n)} \in M$  ( $n = 1, 2, \dots$ ) ekan, unda Boltsano-Veyershtress teoremasiga ko'ra  $\{a^{(n)}\}$  ketma-ketlikdan yaqinlashuvchi qismiy  $\{a^{(n_k)}\}$  ketma-ketlik ajratish mumkin:

$$\lim_{k \rightarrow \infty} a^{(n_k)} = a^0. \quad (12.20)$$

$M$  yopiq to'plam bo'lganligi sababli  $a^0 \in M$  bo'ladi. Yuqoridagi  $\{a^{(n_k)}\}$  ketma-ketlikdan ajratilgan  $\{a^{(n_k)}\}$  qismiy ketma-ketlikning limiti ham  $a^0$  ga teng bo'ladi. Haqiqatdan ham, ushu

$$\rho(a^{(n_k)}, a^0) < \rho(a^{(n_k)}, a^{(n_{k+1})}), \quad \rho(a^{(n_k)}, a^0) < \delta_{n_k} + \rho(a^{(n_k)}, a^{(n_{k+1})}, a^0)$$

tengsizlikdagi  $\delta_{n_k}$  va  $\rho(a^{(n_k)}, a^0)$  lar uchun (12.19) va (12.20) munosabatlarga ko'ra  $k \rightarrow \infty$  da

$$\delta_{n_k} \rightarrow 0, \quad \rho(a^{(n_k)}, a^0) \rightarrow 0$$

bo'lishini e'tiborga olib,  $k \rightarrow \infty$  da  $\rho(a^{(n_k)}, a^0) \rightarrow 0$  ekanini topamiz.

Shunday qilib,

$$a^{(n_k)} \rightarrow a^0, \quad a^{(n_k)} \rightarrow a^0.$$

Qaralayotgan  $f(x)$  funksiyaning shartga ko'ra  $M$  to'plamda uzlusiz. ekanligidan

$$f(a^{(n_k)}) \rightarrow f(a^0), \quad f(a^{(n_k)}) \rightarrow f(a^0)$$

bo'lib, ulardan esa

$$f(a^{(n_k)}) = f(a^{(n_k)}) \rightarrow 0$$

bo'lishi kelib chiqadi. Bu esa  $\forall n_k$  lar uchun

$$|f(a^{(n_k)}) - f(a^{(n_k)})| \geq \epsilon$$

deb qilingan farazga ziddir. Bunday ziddiyatning kelib chiqishiga sabab  $f(x)$  funksiyaning  $M$  to'plamda tekis uzlusizlik shartini qanoatlantirmaydi deb olinishidir. Demak, funksiya  $M$  to'plamda tekis uzlusiz. ▶

Biror  $M \subset R^n$  to'plam berilgan bo'lsin. Bu to'plamda ixtiyoriy ikkita  $x'$  va  $x''$  nuqlalarni olib, ular orasidagi  $\rho(x', x'')$  masofani topamiz. Agar  $x'$  va  $x''$  nuqlalarni  $M$  to'plamda o'zgartira borsak, unda  $\{\rho(x', x'')\}$  to'plam hosil bo'ladi. Odalda, bu to'plamning aniq yuqori chegarasi  $\sup\{\rho(x', x'')\}$  ( $x' \in M, x'' \in M$ ) to'plamning diametri deb ataladi va u  $d(M)$  kabi belgilanadi:

$$d(M) = \sup\{\rho(x', x'')\} \quad (x' \in M, x'' \in M).$$

**25-ta'rif. Ushbu**

$$\sup\{f(x') - f(x'')\} \quad (x' \in M, x'' \in M)$$

miqdor  $f(x)$  funksiyaning  $M$  to'plamdagagi tehranishi deb ataladi va u  $\omega(f, M)$  kabi belgilanadi:

$$\omega(f, M) = \sup\{f(x') - f(x'')\} \quad (x' \in M, x'' \in M)$$

Yuqorida keltirilgan Kantor teoremasidan muhim natija kelib chiqadi.

**2-natija.**  $f(x)$  funksiya chegaralangan yopiq to'plamda uzlusiz bo'lisin. U holda  $\forall \varepsilon > 0$  son olinganda ham  $M$  to'plamni chekli sondagi  $M_k$  to'plamlarga shunday ajratish mumkinki,

$$\bigcup_k M_k = M.$$

$$M_k \cap M_i = \emptyset \quad (k \neq i)$$

$$\omega(f, M_k) < \varepsilon$$

bo'ladi.

◀  $f(x)$  funksiya chegaralangan yopiq  $M$  to'plamda uzlusiz bo'lisin. Kantor teoremasiga ko'ra tekis uzlusiz bo'ladi. Binobarin,  $\forall \varepsilon > 0$  son uchun shunday  $\delta > 0$  topiladi,  $\rho(x', x'') < \delta$  bo'lgan  $\forall x', x'' \in M$  uchun

$$|f(x') - f(x'')| < \varepsilon$$

bo'ladi.

$M$  to'plamni diametrlari shu  $\delta$  bo'lgan  $M_k$  to'plamlarga ajratamiz. Ravshanki, bu holda

$$\rho(x', x'') < \delta \quad (x', x'' \in M_k)$$

bo'ladi va demak,

$$|f(x'') - f(x')| < \varepsilon$$

tengsizlik bajariladi. Bundan

$$\sup\{|f(x'') - f(x')|\} \leq \varepsilon$$

ya'ni  $\omega(f, M_k) \leq \varepsilon$  bo'lishi kelib chiqadi. ▶

### Mashqlar

**12.13.**  $R^2$  va  $R'$  to'plamlarda ikki nuqta orasidagi masofa yozilsin va masofaning 3 ta xossasi isbotlansin.

**12.14.**  $R^2$  va  $R^3$  fazolarda ochiq shar va sharlarning geometrik tasvirlari keltirilsin.

**12.15.**  $R^n$  fazodagi  $\{x^{(n)}\}$  ketma-ketlik yaqinlashuchi bo'lsa, uning chegaralanganligi isbotlansin.

**12.16.** Ikki va uch o'zgaruvchili funksiyalarning ta'riflari keltirilsin.

**12.17.** Ushbu

$$f(x_1, x_2) = \arcsin(x_1 + x_2)$$

funksiyaning aniqlanish to'plami topilsin.

**12.18.** Ushbu

$$f(x_1, x_2) = \begin{cases} x_1 + x_2 \sin \frac{1}{x_1}, & \text{agar } x_1 \neq 0 \text{ bo'lsa,} \\ 0, & \text{agar } x_1 = 0 \text{ bo'lsa} \end{cases}$$

funksiya uchun

$$\lim_{\substack{x_1 \rightarrow 0 \\ x_2 \rightarrow 0}} f(x_1, x_2) = 0$$

bo'lishi isbotlansin.

### 12.19. Ushbu

$$f(x_1, x_2) = \begin{cases} (x_1 + x_2) \sin \frac{1}{x_1} \sin \frac{1}{x_2}, & \text{agar } (x_1, x_2) \neq (0, 0) \text{ bo'lsa,} \\ 0, & \text{agar } (x_1, x_2) = (0, 0) \text{ bo'lsa} \end{cases}$$

funksiyaning  $(0, 0)$  nuqtada takroriy limitlarining mavjud emasligi isbotiansin.

### 12.20. Ushbu

$$f(x_1, x_2) = \begin{cases} \frac{1}{\sin^2 \pi x_1 + \sin^2 \pi x_2}, & \text{agar } \sin^2 \pi x_1 + \sin^2 \pi x_2 \neq 0 \text{ bo'lsa,} \\ 0, & \text{agar } \sin^2 \pi x_1 + \sin^2 \pi x_2 = 0 \text{ bo'lsa} \end{cases}$$

funksiya uzlucksizlikka tekshirilsin.

**Ko'p o'zgaruvchili funksiyaning hosila  
va differensiallari**

Ushbu bobda biz ko'p o'zgaruvchili funksiyalar differensial hisobi bilan shug'ullanamiz. Kiritiladigan va o'rganiladigan hosilalar va differensiallar tushunchalari bir o'zgaruvchining funksiyalari uchun kiritilgan mos tushunchalarning tegishlicha umumlashtirilishidan iborat bo'ladi. Ayni paytda, biz ko'ramizki, ko'p o'zgaruvchili funksiyalar uchun xos bo'lgan bir qancha yangi tushunchalar ham (yo'naliш bo'yicha hosila, to'la differensial va xokazo) o'rganiladi.

*I-§. Ko'p o'zgaruvchili funksiyaning hosilalari*

*1º. Funksiya xususiy hosilasining ta'rifsi.*  $f(x) = f(x_1, x_2, \dots, x_m)$  funksiya ochiq  $M(M \subset R^m)$  to'plamda berilgan bo'lsin. Bu to'plamda  $x^0 = (x_1^0, x_2^0, \dots, x_m^0)$  nuqta olib, uning birinchi koordinatasi  $x_1^0$  ga shunday  $\Delta x_1$  ( $\Delta x_1 \geq 0$ ) orttirma beraylikki,  $(x_1^0 + \Delta x_1, x_2^0, \dots, x_m^0) \in M$  bo'lsin. Natijada  $f(x_1, x_2, \dots, x_m)$  funksiya ham  $(x_1^0, x_2^0, \dots, x_m^0)$  nuqtada  $x_1$  o'zgaruvchisi bo'yicha

$$\Delta_{x_1} f = f(x_1^0 + \Delta x_1, x_2^0, \dots, x_m^0) - f(x_1^0, x_2^0, \dots, x_m^0)$$

xususiy orttirmaga ega bo'ladi.

*1-ta'rif.* Agar  $\Delta x_1 \rightarrow 0$  da ushbu limit

$$\lim_{\Delta x_1 \rightarrow 0} \frac{\Delta_{x_1} f}{\Delta x_1} = \lim_{\Delta x_1 \rightarrow 0} \frac{f(x_1^0 + \Delta x_1, x_2^0, \dots, x_m^0) - f(x_1^0, x_2^0, \dots, x_m^0)}{\Delta x_1}$$

majud va chekli bo'lsa, bu limit  $f(x_1, x_2, \dots, x_m)$  funksiyaning  $(x_1^0, x_2^0, \dots, x_m^0)$  nuqtada  $x_1$  o'zgaruvchisi bo'yicha xususiy hosilasi deb ataladi va

$$\frac{\partial f}{\partial x_1}(x_1^0, x_2^0, \dots, x_m^0), \quad f'_{x_1}(x_1^0, x_2^0, \dots, x_m^0), \quad f'_{x_1}$$

belgilarning biri bilan belgilanadi. Demak,

$$f'_{x_1}(x^0) = \frac{\partial f}{\partial x_1}(x^0) = \lim_{\Delta x_1 \rightarrow 0} \frac{\Delta_{x_1} f}{\Delta x_1}$$

$f(x_1, x_2, \dots, x_m)$  funksiyaning  $(x_1^0, x_2^0, \dots, x_m^0)$  nuqtada  $x_1$  o'zgaruvchisi bo'yicha xususiy hosilasini quyidagi

$$f'_{x_1}(x^0) = \lim_{x_1 \rightarrow x_1^0} \frac{f(x_1, x_2^0, \dots, x_m^0) - f(x_1^0, x_2^0, \dots, x_m^0)}{x_1 - x_1^0}$$

ham ta'riflashi mumkin.

Xuddi shunga o'xshash  $f(x_1, x_2, \dots, x_m)$  funksiyaning boshqa o'zgaruvchilari buyicha xususiy hosilalari ta'riflanadi:

$$\frac{\partial f}{\partial x_2} = \lim_{\Delta x_2 \rightarrow 0} \frac{\Delta x_2 f}{\Delta x_2} = \lim_{\Delta x_2 \rightarrow 0} \frac{f(x_1^0, x_2^0 + \Delta x_2, x_3^0, \dots, x_m^0) - f(x_1^0, x_2^0, \dots, x_m^0)}{\Delta x_2}.$$

$$\frac{\partial f}{\partial x_m} = \lim_{\Delta x_m \rightarrow 0} \frac{\Delta x_m f}{\Delta x_m} = \lim_{\Delta x_m \rightarrow 0} \frac{f(x_1^0, x_2^0, \dots, x_m^0 + \Delta x_m) - f(x_1^0, x_2^0, \dots, x_m^0)}{\Delta x_m}$$

Demak, ko'p o'zgaruvchili  $f(x_1, x_2, \dots, x_m)$  funksiyaning biror  $(x_1^0, x_2, \dots, x_m^0)$  nuqtada  $x_k$  ( $k = 1, 2, \dots, m$ ) o'zgaruvchisi bo'yicha xususiy hosilasini tafsiflashda bu funksiyaning  $x_k$  ( $k = 1, 2, \dots, m$ ) o'zgaruvchidan boshqa barcha o'zgaruvchilari o'zgarmas deb hisoblanar ekan. Shunday qilib,  $f(x_1, x_2, \dots, x_m)$  funksiyaning xususiy hosilalari  $f'_1, f'_2, \dots, f'_m$  1-qism, 6-bob, 1-§ da o'rganilgan hosila - bir o'zgaruvchili funksiya hosilasi kabi ekanligini ko'ramiz. Demak, ko'p o'zgaruvchili funksiyalarning xususiy hosilalarini hisoblashda bir o'zgaruvchili funksiyaning hosilasini hisoblashdagi ma'lum bo'lgan qoida va jadvallardan to'liq foydalaniш mumkin.

**13.1-misol.** Ushbu

$$f(x_1, x_2) = \frac{1}{\sqrt{x_2}} e^{-\frac{x_1+x_2}{2}}$$

funksiyaning  $(x_1, x_2) \in R^2$  ( $x_2 > 0$ ) nuqtadagi xususiy hosilalari topilsin.

$$\begin{aligned} \frac{\partial f}{\partial x_1} &= \frac{\partial}{\partial x_1} \left( \frac{1}{\sqrt{x_2}} e^{-\frac{x_1+x_2}{2}} \right) = -\frac{1}{2\sqrt{x_2}} e^{-\frac{x_1+x_2}{2}}, \\ \frac{\partial f}{\partial x_2} &= \frac{\partial}{\partial x_2} \left( \frac{1}{\sqrt{x_2}} e^{-\frac{x_1+x_2}{2}} \right) = -\frac{1}{2\sqrt{x_2}} e^{-\frac{x_1+x_2}{2}} - \frac{1}{2\sqrt{x_2}} e^{-\frac{x_1+x_2}{2}} = \\ &= -\frac{1}{2\sqrt{x_2}} e^{-\frac{x_1+x_2}{2}} \left( 1 + \frac{1}{x_2} \right). \end{aligned}$$

**13.2-misol.** Ushbu

$$f(x_1, x_2) = \begin{cases} \frac{2x_1 x_2}{x_1^2 + x_2^2}, & \text{agar } (x_1, x_2) \neq (0, 0) \text{ bo'lsa}, \\ 0, & \text{agar } (x_1, x_2) = (0, 0) \text{ bo'lsa} \end{cases}$$

funksiyaning xususiy hosilalari topilsin.

**◀ Aytaylik,**  $(x_1, x_2) \neq (0, 0)$  bo'lsin. U holda

$$\frac{\partial f}{\partial x_1} = \frac{\partial}{\partial x_1} \left( \frac{2x_1 x_2}{x_1^2 + x_2^2} \right) = \frac{2x_1(x_1^2 + x_2^2) - 2x_1 x_2 2x_1}{(x_1^2 + x_2^2)^2} = \frac{2x_2(x_2^2 - x_1^2)}{(x_1^2 + x_2^2)^2}$$

$$\frac{\partial f}{\partial x_2} = \frac{\partial}{\partial x_2} \left( \frac{2x_1 x_2}{x_1^2 + x_2^2} \right) = \frac{2x_1(x_2^2 + x_1^2) - 2x_1 x_2 2x_2}{(x_1^2 + x_2^2)^2} = \frac{2x_1(x_1^2 - x_2^2)}{(x_1^2 + x_2^2)^2}$$

bo'ladi.

Endi  $(x_1, x_2) = (0, 0)$  bo'lsin. U holda ta'rifga binoan

$$\frac{\partial f(0,0)}{\partial x_1} = \lim_{\Delta x_1 \rightarrow 0} \frac{f(\Delta x_1, 0) - f(0,0)}{\Delta x_1} = 0.$$

$$\frac{\partial f(0,0)}{\partial x_2} = \lim_{\Delta x_2 \rightarrow 0} \frac{f(0, \Delta x_2) - f(0,0)}{\Delta x_2} = 0$$

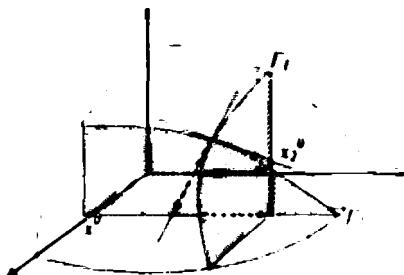

bo'ladi.

Demak, berilgan  $f(x_1, x_2)$  funksiya  $\forall (x_1, x_2) \in R^2$  da xususiy hosilalarga ega. ▶

**2'. Xususiy hosilaning geometrik ma'nosi.** Soddalik uchun ikki o'zgaruvchili funksiya xususiy hosilalarining geometrik ma'nosini keltiramiz.

$f(x_1, x_2)$  funksiya ochiq  $M (M \subset R^2)$  to'plamda berilgan bo'lib,  $(x_1^0, x_2^0) \in M$  bo'lsin. Bu funksiya  $(x_1^0, x_2^0)$  nuqtada  $f_{x_1}(x_1^0, x_2^0)$ ,  $f_{x_2}(x_1^0, x_2^0)$  xususiy hosilalarga ega deylik. Ta'rifga ko'ra  $f_{x_1}(x_1^0, x_2^0)$  va  $f_{x_2}(x_1^0, x_2^0)$  xususiy hosilalar mos ravishda ushbu  $y_1 = f(x_1, x_2^0)$  va  $y_2 = f(x_1^0, x_2)$  bir o'zgaruvchili funksiyalarning  $x_1^0$  va  $x_2^0$  dagi hosilalaridan iborat.

Faraq qilaylik,  $y = f(x_1, x_2)$  funksiyaning grafigi 48-chizmada ko'rsatilgan sirtni tasvirlasin.

48-chizma

Unda  $y_1 = f(x_1, x_2^0)$  va  $y_2 = f(x_1^0, x_2)$  funksiyalarning grafiklari mos ravishda  $y = f(x_1, x_2)$  sirt bilan  $x_2 = x_2^0$  tekislikning hamda shu sirt bilan  $x_1 = x_1^0$  tekislikning kesishidan hosil bo'lgan  $\Gamma_1$  va  $\Gamma_2$  chiziqlardan iborat.

Ma'lumki, bir o'zgaruvchili  $u = \phi(x)$  funksiyaning biror  $x_0 (x_0 \in R)$  nuqtadagi hosilasining geometrik ma'nosi (1-qism, 6-bob, 1-§) bu funksiya tasvirlangan egri chiziqliga  $(x_0, \phi(x_0))$  nuqtada o'tkazilgan urinmaning burchak koeffitsientidan iborat edi.  $f_{x_1}(x_1^0, x_2^0)$  va  $f_{x_2}(x_1^0, x_2^0)$  xususiy hosilalar mos ravishda  $\Gamma_1$  va  $\Gamma_2$  egri chiziqlarga  $(x_1^0, x_2^0)$  nuqtada o'tkazilgan urinmalarning  $ox_1$  va  $ox_2$  o'qlari bilan tashkil etgan burchakning tangensini bildiradi. Demak,  $f_{x_1}(x_1^0, x_2^0)$  va  $f_{x_2}(x_1^0, x_2^0)$  xususiy hosilalar  $y = f(x_1, x_2)$  sirtning mos ravishda  $ox_1$  va  $ox_2$  o'qlar yo'naliishi bo'yicha o'zgarish darajasini ko'rsatadi.

## 2-S. Ko'p o'zgaruvchili funksiyalarning differensiallanuvchiligi

*I". Funksiyaning differensiallanuvchiligi tushunchasi. Differensiallanuvchilikning zaruriy sharti.*  $f(x) = f(x_1, x_2, \dots, x_m)$  funksiya ochiq  $M(M \subset R^m)$  to'plamda berilgan bo'lsin. Bu to'plamda  $x^0 = (x_1^0, x_2^0, \dots, x_m^0)$  nuqta bilan birga  $(x_1^0 + \Delta x_1, x_2^0 + \Delta x_2, \dots, x_m^0 + \Delta x_m)$  nuqtani olib, berilgan funksiyaning to'la orttirmasi

$$\Delta f(x^0) = f(x_1^0 + \Delta x_1, x_2^0 + \Delta x_2, \dots, x_m^0 + \Delta x_m) - f(x_1^0, x_2^0, \dots, x_m^0)$$

ni qaraymiz.

Ravshanki, funksiyaning  $\Delta f(x_0)$  orttirmasi argumentlar orttimalari  $\Delta x_1, \Delta x_2, \dots, \Delta x_m$  larga bog'liq.

*2-ta'rif.* Agar  $f(x)$  funksiyaning  $x^0$  nuqtadagi  $\Delta f(x_0)$  orttirmasini

$$\Delta f(x^0) = A_1 \Delta x_1 + A_2 \Delta x_2 + \dots + A_m \Delta x_m + \alpha_1 \Delta x_1 + \alpha_2 \Delta x_2 + \dots + \alpha_m \Delta x_m \quad (13.1)$$

ko'rinishda ifodalash mumkin bo'lsa,  $f(x)$  funksiya  $x^0$  nuqtada differensiallanuvchi deb ataladi, bunda  $A_1, A_2, \dots, A_m$  lar  $\Delta x_1, \Delta x_2, \dots, \Delta x_m$  larga bog'liq bo'lмаган o'zgarmaslar,  $\alpha_1, \alpha_2, \dots, \alpha_m$  lari esa  $\Delta x_1, \Delta x_2, \dots, \Delta x_m$  larga bog'liq va  $\Delta x_1 \rightarrow 0, \Delta x_2 \rightarrow 0, \dots, \Delta x_m \rightarrow 0$  da  $\alpha_1 \rightarrow 0, \alpha_2 \rightarrow 0, \dots, \alpha_m \rightarrow 0$  ( $\Delta x_1 = \Delta x_2 = \dots = \Delta x_m = 0$  bo'lganda  $\alpha_1 = \alpha_2 = \dots = \alpha_m = 0$  deb olinadi.)

Agar  $f(x)$  funksiya  $M$  to'plamning har bir nuqtasida differensiallanuvchi bo'lsa,  $f(x)$  funksiya  $M$  to'plamda differensiallanuvchi deb ataladi.

*13.3-misol.* Ushbu  $f(x_1, x_2) = x_1^2 + x_2^2$  funksiyani  $\forall (x_1^0, x_2^0) \in R^2$  nuqtada differensiallanuvchi bo'lishi ko'rsatilsin.

• Haqiqatdan ham,  $(x_1^0, x_2^0)$  nuqtada funksiyaning orttirmasi

$$\begin{aligned} \Delta f &= f(x_1^0 + \Delta x_1, x_2^0 + \Delta x_2) - f(x_1^0, x_2^0) = (x_1^0 + \Delta x_1)^2 + (x_2^0 + \Delta x_2)^2 - \\ &- (x_1^0)^2 - (x_2^0)^2 = 2x_1^0 \Delta x_1 + 2x_2^0 \Delta x_2 + (\Delta x_1)^2 + (\Delta x_2)^2 \end{aligned}$$

bo'lib, unda  $A_1 = 2x_1^0$ ,  $A_2 = 2x_2^0$ ,  $\alpha_1 = \Delta x_1$ ,  $\alpha_2 = \Delta x_2$  deyilsa, natijada

$$\Delta f = A_1 \Delta x_1 + A_2 \Delta x_2 + \alpha_1 \Delta x_1 + \alpha_2 \Delta x_2$$

bo'ladı. Bu esa berilgan funksiyaning  $\forall (x_1, x_2) \in R^2$  nuqtada differensiallanuvchi ekanligini bildiradi. ▶

$f(x)$  funksiyaning  $x^0$  nuqtada differensiallanuvchilik sharti (13.1) ni quyidagi

$$\Delta f(x^0) = A_1 \Delta x_1 + A_2 \Delta x_2 + \dots + A_m \Delta x_m + o(\rho) \quad (13.2)$$

ko'rinishda ham yozish mumkin, bunda

$$\rho = \sqrt{(\Delta x_1)^2 + (\Delta x_2)^2 + \dots + (\Delta x_m)^2}.$$

Endi differensiallanuvchi funksiyalar haqida ikkita teorema keltiramiz.

**I-teorema.** Agar  $f(x)$  funksiya  $x^0$  nuqtada differensiallanuvchi bo'lsa, u holda bu funksiya shu nuqtada uzlaksiz bo'ladi.

◀  $f(x)$  funksiya  $x^0$  nuqtada differensiallanuvchi bo'lsin. U holda ta'rifga ko'ra funksiya ortitmasi uchun

$\Delta f(x^0) = A_1 \Delta x_1 + A_2 \Delta x_2 + \dots + A_m \Delta x_m + \alpha_1 \Delta x_1 + \alpha_2 \Delta x_2 + \dots + \alpha_m \Delta x_m$   
bo'ladi, bunda  $A_1, A_2, \dots, A_m$  o'zgarmas,  $\Delta x_1 \rightarrow 0, \Delta x_2 \rightarrow 0, \dots, \Delta x_m \rightarrow 0$  da  $\alpha_1 \rightarrow 0, \alpha_2 \rightarrow 0, \dots, \alpha_m \rightarrow 0$ .

Yuqoridagi tenglikdan

$$\lim_{\substack{\Delta x_1 \rightarrow 0 \\ \Delta x_2 \rightarrow 0 \\ \dots \\ \Delta x_m \rightarrow 0}} \Delta f(x^0) = 0$$

bo'lishi kelib chiqadi. Bu esa  $f(x)$  funksiya  $x^0$  nuqtada uzlaksizligini bildiradi. ▶

**2-teorema.** Agar  $f(x)$  funksiya  $x^0$  nuqtada differensiallanuvchi bo'lsa. u holda bu funksiyaning shu nuqtada barcha xususiy hosilalari  $f'_{x_1}(x^0), f'_{x_2}(x^0), \dots, f'_{x_m}(x^0)$  mavjud va ular mos ravishda (13.1) munosabatdagi  $A_1, A_2, \dots, A_m$  larga teng bo'ladi:

$$f'_{x_1}(x^0) = A_1, \quad f'_{x_2}(x^0) = A_2, \dots, f'_{x_m}(x^0) = A_m.$$

◀  $f(x)$  funksiya  $x^0$  nuqtada differensiallanuvchi bo'lsin.

U holda ta'rifga ko'ra

$$\Delta f(x^0) = A_1 \Delta x_1 + A_2 \Delta x_2 + \dots + A_m \Delta x_m + \alpha_1 \Delta x_1 + \alpha_2 \Delta x_2 + \dots + \alpha_m \Delta x_m$$

bo'ladi. Bu tenglikda

$$\Delta x_1 \neq 0, \quad \Delta x_2 = \Delta x_3 = \dots = \Delta x_m = 0$$

deb olsak, unda (13.1) ushbu

$$\Delta x_1 f(x^0) = A_1 \Delta x_1 + \alpha_1 \Delta x_1$$

ko'rinishni oladi. Bu tenglikdan quyidagini topamiz:

$$\lim_{\Delta x_1 \rightarrow 0} \frac{\Delta x_1 f(x^0)}{\Delta x_1} = \lim_{\Delta x_1 \rightarrow 0} (A_1 + \alpha_1) = A_1.$$

Demak,

$$f'_{x_1}(x^0) = A_1.$$

Xuddi shunga o'xshasha  $f(x)$  funksiya  $x^0$  nuqtada  $f'_{x_2}(x^0), f'_{x_3}(x^0), \dots, f'_{x_m}(x^0)$  xususiy hosilalarining mavjudligi hamda

$$f'_{x_2}(x^0) = A_2, \quad f'_{x_3}(x^0) = A_3, \dots, f'_{x_m}(x^0) = A_m.$$

ekanligi ko'rsatiladi. ▶

**I-natiqa.** Agar  $f(x)$  funksiya  $x^0$  nuqtada differensiallanuvchi bo'lsa, u holda

$$\Delta f(x^0) = f'_{x_1}(x^0) \Delta x_1 + f'_{x_2}(x^0) \Delta x_2 + \dots + f'_{x_m}(x^0) \Delta x_m + o(\rho)$$

bo'ladi.

*1-eslatma.*  $f(x)$  funksiyaning biror  $x^0$  nuqtada barcha xususiy hosilalari  $f'_{x_1}(x^0), f'_{x_2}(x^0), \dots, f'_{x_n}(x^0)$  ning mavjud bo'lishidan funksiyaning shu nuqtada differensiallanuvchi bo'lishi har doim kelib chiqavermaydi.

*13.4-misol.* Ushbu

$$f(x_1, x_2) = \begin{cases} \frac{x_1 x_2}{\sqrt{x_1^2 + x_2^2}}, & \text{agar } (x_1, x_2) \neq (0, 0) \\ 0, & \text{agar } (x_1, x_2) = (0, 0) \end{cases}$$

funksiyaning  $(0, 0)$  nuqtada differensiallanuvchi emasligi ko'rsatilsin.

◀ Bu funksiya  $(0, 0)$  nuqtada xususiy hosilalarga ega:

$$f'_{x_1}(0, 0) = \lim_{\Delta x_1 \rightarrow 0} \frac{f(\Delta x_1, 0) - f(0, 0)}{\Delta x_1} = 0,$$

$$f'_{x_2}(0, 0) = \lim_{\Delta x_2 \rightarrow 0} \frac{f(0, \Delta x_2) - f(0, 0)}{\Delta x_2} = 0.$$

Berilgan funksiyaning  $(0, 0)$  nuqtada orttirmasi:

$$\Delta f(0, 0) = f(\Delta x_1, \Delta x_2) - f(0, 0) = \frac{\Delta x_1 \Delta x_2}{\sqrt{\Delta x_1^2 + \Delta x_2^2}}$$

bo'lib, uni (13.1) yoki (13.2) ko'rinishida ifodalab bo'lmaydi. Buni isbotlash maqsadida, teskarisini, ya'ni  $f(x_1, x_2)$  funksiya  $(0, 0)$  nuqtada differensiallanuvchi bo'lsin deb faraz qilaylik. Unda

$$\Delta f(0, 0) = f'_{x_1}(0, 0)\Delta x_1 + f'_{x_2}(0, 0)\Delta x_2 + \alpha_1 \Delta x_1 + \alpha_2 \Delta x_2 = \alpha_1 \Delta x_1 + \alpha_2 \Delta x_2,$$

bo'lib, bu munosabatda  $\Delta x_1 \rightarrow 0, \Delta x_2 \rightarrow 0$  da  $\alpha_1 \rightarrow 0, \alpha_2 \rightarrow 0$  bo'lishi lozim. Demak,

$$\frac{\Delta x_1 \Delta x_2}{\sqrt{\Delta x_1^2 + \Delta x_2^2}} = \alpha_1 \Delta x_1 + \alpha_2 \Delta x_2. \quad (13.3)$$

Ma'lumki,  $\Delta x_1$  va  $\Delta x_2$  lar ixtiyoriy orttirmalar. Jumladan,  $\Delta x_1 = \Delta x_2$  bo'lganda (13.3) tenglik ushbu

$$\frac{\Delta x_1}{\sqrt{2}} = \Delta x_1 (\alpha_1 + \alpha_2)$$

ko'rinishiga kelib, undan esa

$$\alpha_1 + \alpha_2 = \frac{\sqrt{2}}{2}$$

bo'lishi kelib chiqadi. Natijada  $\Delta x_1 \rightarrow 0, \Delta x_2 \rightarrow 0$  da  $\alpha_1$  va  $\alpha_2$  miqdorlarning nolga intilmasligini topamiz. Bu esa  $f(x_1, x_2)$  funksiyaning  $(0, 0)$  nuqtada differensiallanuvchi bo'lsin deb qilingan farazga zid. ▶

Shunday qilib, funksiyaning biror nuqtada barcha xususiy hosilalarga ega bo'lishi, funksiyaning shu nuqtada differensiallanuvchi bo'lischening zaruriy shartidan ihorat ekan.

*2º. Funksiyoning differensiallanuvchiligidining yetarli sharti.* Endi ko'p o'zgaruvchili funksiya differensiallanuvchi bo'lischening yetarli shartini keltiramiz.

$f(x) = f(x_1, x_2, \dots, x_n)$  funksiya ochiq  $M$  ( $M \subset R^n$ ) to'plamda berilgan bo'lib,  $x^0 = (x_1^0, x_2^0, \dots, x_n^0) \in M$  bo'lsin.

**3-teorema.** Agar  $f(x)$  funksiya  $x^0$  nuqtanining biror atrosida barcha o'zgaruvchilari bo'yicha xususiy hosilalarga ega bo'lib, bu xususiy hosilalar shu  $x^0$  nuqtada uzlusiz bolsa,  $f(x)$  funksiya  $x^0$  nuqtada differensialanuvchi bo'ladi.

$\blacktriangle x^0 \in M$  nuqtani olib, koordinatalariga mos ravishda shunday  $\Delta x_1, \Delta x_2, \dots, \Delta x_n$  ortirmalar beraylikki,  $(x_1^0 + \Delta x_1, x_2^0 + \Delta x_2, \dots, x_n^0 + \Delta x_n)$  nuqta  $x^0$  nuqtaning aytilgan atrofiga tegishli bo'l sin. So'ng funksiya  $\varphi$  ta'laliga ortirmasi

$$\Delta f(\mathbf{x}^0) = f(x_1^0 + \Delta x_1, x_2^0 + \Delta x_2, \dots, x_m^0 + \Delta x_m) - f(x_1^0, x_2^0, \dots, x_m^0)$$

**ni quyida qacha yozib olamiz:**

$$N(f(x)) = [f(x_1^0 + \Delta x_1, x_2^0 + \Delta x_2, \dots, x_m^0 + \Delta x_m) - f(x_1^0, x_2^0 + \Delta x_2, \dots, x_m^0 + \Delta x_m)] + \\ + [f(x_1^0, x_2^0 + \Delta x_2, x_3^0 + \Delta x_3, \dots, x_m^0 + \Delta x_m) - f(x_1^0, x_2^0, x_3^0 + \Delta x_3, \dots, x_m^0 + \Delta x_m)] + \\ + \dots + [f(x_1^0, x_2^0, \dots, x_{m-1}^0, x_m^0 + \Delta x_m) - f(x_1^0, x_2^0, \dots, x_m^0)]$$

Bu tenglikning o'ng tomonidagi har bir ayirma tegishli bitta argumentning funksiyasi orttirmasi sifatida qaralishi mumkin. Uning uchun Lagranj teoremasini tatlqiq qila olamiz, chunki teoremamizda keltirilgan shartlar Lagranj teoremasi shartlarining bajarilishini ta'minlaydi:

$$\Delta f(x^0) = f'_x(x_1^0 + \theta_1 \Delta x_1, x_2^0 + \Delta x_2, \dots, x_m^0 + \Delta x_m) \cdot \Delta x_1 + \\ + f'_{x_2}(x_1^0, x_2^0 + \theta_2 \Delta x_2, x_3^0 + \Delta x_3, \dots, x_m^0 + \Delta x_m) \cdot \Delta x_2 + \\ + \dots + \\ + f'_{x_m}(x_1^0, x_2^0, \dots, x_{m-1}^0, x_m^0 + \theta_m \Delta x_m) \cdot \Delta x_m. \quad (13.4)$$

bunda

$$0 < \theta_i < 1 \quad (i = 1, 2, \dots, m).$$

Odatda (13.4) funksiya orttirmsasining formulasi deb ataladi. Shartga ko'ra  $x^0$  nuqtadagi  $f'_1, f'_2, \dots, f'_n$  xususiy hosilalar u兹luksiz. Shunga ko'ra

$$\begin{aligned} f'_{x_1}(x_1^0 + \theta_1 \Delta x_1, x_2^0 + \Delta x_2, \dots, x_m^0 + \Delta x_m) &= f'_{x_1}(x^0) + \alpha_1, \\ f'_{x_2}(x_1^0, x_2^0 + \theta_2 \Delta x_2, x_3^0 + \Delta x_3, \dots, x_m^0 + \Delta x_m) &= f'_{x_2}(x^0) + \alpha_2, \end{aligned} \quad (13.5)$$

bo'lib, unda  $\Delta x_1 \rightarrow 0, \Delta x_2 \rightarrow 0, \dots, \Delta x_n \rightarrow 0$  da  $a_1 \rightarrow 0, a_2 \rightarrow 0, \dots, a_n \rightarrow 0$  bo'ladidi.

(13.4) va (13.5) munosabatlardan

$$\Delta f(x^0) = f'_{x_1}(x^0)\Delta x_1 + f'_{x_2}(x^0)\Delta x_2 + \dots + f'_{x_m}(x^0)\Delta x_m +$$

$$+ \alpha_1\Delta x_1 + \alpha_2\Delta x_2 + \dots + \alpha_m\Delta x_m$$

bo'lishi kelib chiqadi. Bu esa  $f(x)$  funksiyaning  $x^0$  nuqtada differensiallanuvchi ekanligini bildiradi. ►

Bir va ko'p o'zgaruvchili funksiyalarda funksiyaning differensiallanuvchiligi tushunchasi kiritildi. (qaralsin, 1-qism, 6-bob, 4-§ hamda ushbu bobning 2-§.). Ularni solishtirib quyidagi xulosalarga kelamiz.

1) Bir o'zgaruvchili funksiyalarda ham ko'p o'zgaruvchili funksiyalarda ham funksiyaning biror nuqtada differensiallanuvchi bo'lismidan uning shu nuqtada uzlusiz bo'lishi kelib chiqadi. Demak, bir va ko'p o'zgaruvchili funksiyalarda funksiyaning differensiallanuvchi bo'lishi bilan uning uzlusiz bo'lishi orasidagi munosabat bir xil.

2) Ma'lumki, bir o'zgaruvchili funksiyalarda funksiyaning biror nuqtada differensiallanuvchi bo'lismidan uning shu nuqtada chekli hosilaga ega bo'lishi kelib chiqadi va aksincha, funksiyaning biror nuqtada chekli hosilaga ega bo'lismidan uning shu nuqtada differensiallanuvchi bo'lishi kelib chiqadi.

Ko'p o'zgaruvchili funksiyalarda funksiyaning biror nuqtada differensiallanuvchi bo'lismidan uning shu nuqtada barcha chekli xususiy hosilalarga ega bo'lishi kelib chiqadi. Biroq funksiyaning biror nuqtada barcha chekli xususiy hosilalarga ega bo'lismidan uning shu nuqtada differensiallanuvchi bo'lishi har doim ketib chiqavermaydi.

Demak, bir va ko'p o'zgaruvchili funksiyalarda funksiyaning differensiallanuvchi bo'lishi bilan uning hosilaga (xususiy hosilaga) ega bo'lishi orasidagi munosabat bir xil emas ekan.

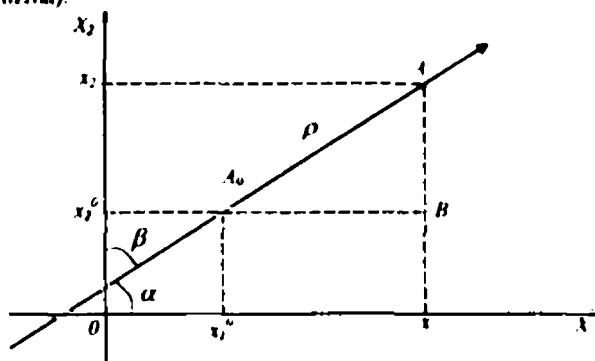

### 3-§. Yo'naliш bo'yicha hosila

Ma'lumki, bir o'zgaruvchili  $y = f(x)$  funksiyaning ( $x \in R, y \in R$ )  $\frac{dy}{dx}$  hosilasi bu funksiyaning o'zgarish tezligini bildirar edi. Ko'p o'zgaruvchili  $y = f(x_1, x_2, \dots, x_m)$  funksiyaning xususiy hosilalari ham bir o'zgaruvchili funksiyaning hosilasi kabi ekanligini e'tiborga olib, bu  $\frac{\partial y}{\partial x_1}, \frac{\partial y}{\partial x_2}, \dots, \frac{\partial y}{\partial x_m}$  xususiy hosilalari ham  $y = f(x_1, x_2, \dots, x_m)$  funksiyaning mos ravishda  $\alpha_1, \alpha_2, \dots, \alpha_m$  o'qlar bo'yicha o'zgarish tezligini ifodalaydi deb aytish mumkin.

Endi funksiyaning ixtiyoriy yo'naliш bo'yicha o'zgarish tezligini ifodalovchi tushuncha bilan tanishaylik. Soddalik uchun ikki o'zgaruvchili funksiyani qaraymiz.

$y = f(x_1, x_2) = f(A)$  funksiya ochiq  $M$  to'plamda ( $M \subset R^2$ ) berilgan bo'lisin. Bo' to'plamda ixtiyoriy  $A_0 = (x_1^0, x_2^0)$  nuqtani olib, u orqali biror to'g'ri chiziq o'tkazaylik va undagi ikki yo'naliшdan birini musbat yo'naliш, ikkinchisini manfiy yo'naliш deh qabul qilaylik. Bu yo'nalgan to'g'ri chiziqni / deylik.

$\alpha$  va  $\beta$  deb / yo'nalgan to'g'ri chiziq musbat yo'nalishi bilan mos ravishda  $x_1$  va  $x_2$  koordinata o'qlarining musbat yo'nalishi orasidagi burchaklarni olaylik (49-chizma).

49-chizma

/ to'g'ri chiziqdagi  $A_0$  nuqtadan farqli va  $M$  to'plamga tegishli bo'lgan  $A$  nuqlarini ( $A = (x_1, x_2)$ ) olaylikki,  $A_0A$  kesma  $M$  to'plamga tegishli bo'lisin. Agarda  $A$  nuqta  $A_0$  ga nisbatan / to'g'ri chiziqning musbat yo'nalishi tomonidan bo'lsa (shakldagidek), u holda  $A_0A$  kesma uzunligi  $\rho(A_0, A)$  ni musbat ishora bilan olishga kelishaylik.

$\Delta A_0AB$  dan

$$\frac{x_1 - x_1^0}{\rho} = \cos \alpha, \quad \frac{x_2 - x_2^0}{\rho} = \cos \beta \quad (13.6)$$

bo'lishi kelib chiqadi. Odatda  $\cos \alpha$  va  $\cos \beta$  lar / to'g'ri chiziqning yo'naltiruvchi kosinuslari deyiladi.

**3-ta'rif.**  $A$  nuqta / yo'nalgan to'g'ri chiziq bo'ylab  $A_0$  nuqtaga intilganda ( $A \rightarrow A_0$ ) ushbu nisbat

$$\frac{f(A) - f(A_0)}{\rho(A_0, A)} = \frac{f(x_1, x_2) - f(x_1^0, x_2^0)}{\rho((x_1^0, x_2^0), (x_1, x_2))}$$

ning limiti mavjud bo'lsa, bu limit  $f(x_1, x_2) = f(A)$  funksiyaning  $A_0 = (x_1^0, x_2^0)$  nuqtiadagi / yo'nalish bo'yicha hosilasi deb ataladi va

$$\frac{df(A_0)}{dt} \text{ yoki } \frac{df(x_1^0, x_2^0)}{dt}$$

kabi belgilanadi. Demak,

$$\frac{df}{dt} = \lim_{A \rightarrow A_0} \frac{f(A) - f(A_0)}{\rho(A_0, A)}$$

Endi  $f(x_1, x_2)$  funksiyaning / yo'nalish bo'yicha hosilasining mavjudligi hamda uni topish masalasi bilan shug'ullanamiz.

**4-teorema.**  $f(x_1, x_2)$  funksiya ochiq  $M$  to'plamda ( $M \subset R^2$ ) berilgan bo'lib,  $A_0 = (x_1^0, x_2^0)$  nuqtada ( $(x_1^0, x_2^0) \in M$ ) differensiallanuvchi bo'lsa, funksiya shu nuqtada har qanday yo'nalish bo'yicha hosilaga ega va

$$\frac{df(x_1^0, x_2^0)}{dx} = \frac{\partial f(x_1^0, x_2^0)}{\partial x_1} \cos \alpha + \frac{\partial f(x_1^0, x_2^0)}{\partial x_2} \cos \beta \quad (13.7)$$

bo'ladi.

◀ Shartga ko'ra  $f(x_1, x_2)$  funksiya  $A_0 = (x_1^0, x_2^0)$  nuqtada differensiallanuvchi. Demak, funksiya ortifmasi

$$f(A) - f(A_0) = f(x_1, x_2) - f(x_1^0, x_2^0)$$

uchun

$$f(A) - f(A_0) = \frac{\gamma(x_1^0, x_2^0)}{\partial x_1}(x_1 - x_1^0) + \frac{\gamma(x_1^0, x_2^0)}{\partial x_2}(x_2 - x_2^0) + o(\rho) \quad (13.8)$$

bo'ladi, bunda

$$\rho = \rho(A_0, A) = \sqrt{(x_1 - x_1^0)^2 + (x_2 - x_2^0)^2}.$$

(13.8) tenglikning har ikki tomonini  $\rho = \rho(A_0, A)$  ga bo'lib, so'ng (13.6) ni e'tiborga olib topamiz.

$$\frac{f(A) - f(A_0)}{\rho(A_0, A)} = \frac{\gamma(x_1^0, x_2^0)}{\partial x_1} \cos \alpha + \frac{\gamma(x_1^0, x_2^0)}{\partial x_2} \cos \beta + \frac{o(\rho)}{\rho}.$$

Bu tenglikda  $A \rightarrow A_0$  da (ya'ni  $\rho \rightarrow 0$  da) limitga o'tsak, unda

$$\lim_{\rho \rightarrow 0} \frac{f(A) - f(A_0)}{\rho(A_0, A)} = \lim_{\rho \rightarrow 0} \frac{f(A) - f(A_0)}{\rho} = \frac{\gamma(x_1^0, x_2^0)}{\partial x_1} \cos \alpha + \frac{\gamma(x_1^0, x_2^0)}{\partial x_2} \cos \beta$$

bo'ladi. Demak,

$$\frac{df(x_1^0, x_2^0)}{dx} = \frac{\gamma(x_1^0, x_2^0)}{\partial x_1} \cos \alpha + \frac{\gamma(x_1^0, x_2^0)}{\partial x_2} \cos \beta. \blacktriangleright$$

### 13.5-misol. Ushbu

$$f(x_1, x_2) = \arctg \frac{x_1}{x_2}$$

funksiyaning I yo'nalish bo'yicha hosilasi topilsin, bunda I birinchi kvadrantning  $(1, 1)$  nuqtadan o'tuvchi va  $(0, 0)$  nuqtadan  $(1, 1)$  nuqtaga qarab yo'nalgan bissektrisasidan iborat.

◀ Berilgan funksiyaning  $A_0 = (1, 1)$  nuqtadagi I yo'nalish bo'yicha hosilasini (13.7) formulaga ko'ra topamiz. Ravshanki,

$$f(x_1, x_2) = \arctg \frac{x_1}{x_2}$$

funksiya  $A_0 = (1, 1)$  nuqtada differensiallanuvchi. Unda (13.7) formulaga ko'ra

$$\begin{aligned} \frac{\partial f(1,1)}{\partial t} - \frac{\partial f(1,1)}{\partial x_1} \cos \frac{\pi}{4} + \frac{\partial f(1,1)}{\partial x_2} \cos \frac{\pi}{4} = \\ = \left( \frac{x_2}{x_1^2 + x_2^2} - \frac{x_1}{x_1^2 + x_2^2} \right) \cdot \frac{\sqrt{2}}{2} = 0 \end{aligned}$$

bo'ladi. ▶

**4-§. Ko'p o'zgaruvchili murakkab funksiyalarning differensiallanuvchiligi. Murakkab funksiyaning hosilasi**

$f(x_1, x_2, \dots, x_m)$  funksiya  $M$  ( $M \subset R^n$ ) to'plamda berilgan bo'lib,  $x_1, x_2, \dots, x_m$  o'zgaruvchilaming har biri o'z navbatida  $t_1, t_2, \dots, t_k$  o'zgaruvchilaming  $T$  ( $T \subset R^k$ ) to'plamda berilgan funksiya bo'lsin:

$$\begin{aligned} x_1 &= \varphi_1(t_1, t_2, \dots, t_k), \\ x_2 &= \varphi_2(t_1, t_2, \dots, t_k), \\ &\dots \\ x_m &= \varphi_m(t_1, t_2, \dots, t_k). \end{aligned} \tag{13.9}$$

Bunda  $(t_1, t_2, \dots, t_k) \in T$  bo'lganda unga mos  $(x_1, x_2, \dots, x_m) \in M$  bo'lsin.

Natijada ushbu

$$f(\varphi_1(t_1, t_2, \dots, t_k), \varphi_2(t_1, t_2, \dots, t_k), \dots, \varphi_m(t_1, t_2, \dots, t_k)) = F(t_1, t_2, \dots, t_k)$$

murakkab funksiyaga ega bo'lamiz.

**1<sup>º</sup>. Murakkab funksiyaning differensiallanuvchiligi.**

**5-teorema** Agar (13.9) funksiyalarning har biri  $(t_1^0, t_2^0, \dots, t_k^0) \in T$  nuqtada differensiallanuvchi bo'lib,  $f(x_1, x_2, \dots, x_m)$  funksiya esa mos  $(x_1^0, x_2^0, \dots, x_k^0) \in M$  nuqtada  $(x_1^0 = \varphi_1(t_1^0, t_2^0, \dots, t_k^0), x_2^0 = \varphi_2(t_1^0, t_2^0, \dots, t_k^0), \dots, x_m^0 = \varphi_m(t_1^0, t_2^0, \dots, t_k^0))$  differensiallanuvchi bo'lsa, u holda murakkab funksiya  $F(t_1, t_2, \dots, t_k)$  ham  $(t_1^0, t_2^0, \dots, t_k^0)$  nuqtada differensiallanuvchi bo'ladi.

◀  $(t_1^0, t_2^0, \dots, t_k^0) \in T$  nuqtani olib, uning koordinatalariga mos ravishda shunday  $(\Delta t_1, \Delta t_2, \dots, \Delta t_k)$  ortitiruvchilar beraylikki,  $(t_1^0 + \Delta t_1, t_2^0 + \Delta t_2, \dots, t_k^0 + \Delta t_k) \in T$  bo'lsin. U holda (13.9) dagi har bir funksiya ham  $(\Delta x_1, \Delta x_2, \dots, \Delta x_m)$  ortitilmalarga va niroyat  $f(x_1, x_2, \dots, x_m)$  funksiya  $\Delta f$  ortirmaga ega bo'ladi.

Shartga ko'ra (13.9) dagi funksiyalarning har biri  $(t_1^0, t_2^0, \dots, t_k^0)$  nuqtada differensiallanuvchi. Demak,

$$\Delta x_1 = \frac{\partial f}{\partial x_1} N_1 + \frac{\partial f}{\partial y_1} N_2 + \dots + \frac{\partial f}{\partial z_1} N_k + o(\rho)$$

$$\Delta x_2 = \frac{\partial f}{\partial x_2} N_1 + \frac{\partial f}{\partial y_2} N_2 + \dots + \frac{\partial f}{\partial z_2} N_k + o(\rho)$$
(13.10)

$$\Delta x_m = \frac{\partial f}{\partial x_m} N_1 + \frac{\partial f}{\partial y_m} N_2 + \dots + \frac{\partial f}{\partial z_m} N_k + o(\rho)$$

bo'ldi, bunda  $\frac{\partial f}{\partial x_i}$  ( $i=1,2,\dots,m$ ,  $j=1,2,\dots,k$ ) hususiy hosilalarning  $(t_1^0, t_2^0, \dots, t_k^0)$  nuqtadagi qiymatlari olingan, va

$$\rho = \sqrt{\Delta x_1^2 + \Delta x_2^2 + \dots + \Delta x_m^2}.$$

Shartga asosan,  $f(x_1, x_2, \dots, x_m)$  funksiya  $(x_1^0, x_2^0, \dots, x_m^0)$  nuqtada differensialanuvchi. Demak,

$$N = \frac{\partial f}{\partial x_1} \Delta x_1 + \frac{\partial f}{\partial x_2} \Delta x_2 + \dots + \frac{\partial f}{\partial x_m} \Delta x_m + \alpha_1 \Delta x_1 + \alpha_2 \Delta x_2 + \dots + \alpha_m \Delta x_m \quad (13.11)$$

bo'ldi, bunda  $\frac{\partial f}{\partial x_i}$  ( $i=1,2,\dots,m$ ) hususiy hosilalarning  $(x_1^0, x_2^0, \dots, x_m^0)$  nuqtadagi qiymatlari olingan va  $\Delta x_1 \rightarrow 0, \Delta x_2 \rightarrow 0, \dots, \Delta x_m \rightarrow 0$  da  $\alpha_1 \rightarrow 0, \alpha_2 \rightarrow 0, \dots, \alpha_m \rightarrow 0$  bo'ldi.

(13.10) va (13.11) munosabatlardan topamiz:

$$\begin{aligned} \Delta f &= \left| \frac{\partial f}{\partial x_1} \left| \frac{\partial x_1}{\partial t_1} N_1 + \frac{\partial x_1}{\partial y_1} N_2 + \dots + \frac{\partial x_1}{\partial z_1} N_k + o(\rho) \right. \right| + \\ &\quad \cdot \left| \frac{\partial f}{\partial x_2} \left| \frac{\partial x_2}{\partial t_1} N_1 + \frac{\partial x_2}{\partial y_2} N_2 + \dots + \frac{\partial x_2}{\partial z_2} N_k + o(\rho) \right. \right| + \\ &\quad \cdot \dots + \\ &\quad \cdot \left| \frac{\partial f}{\partial x_m} \left| \frac{\partial x_m}{\partial t_1} N_1 + \frac{\partial x_m}{\partial y_m} N_2 + \dots + \frac{\partial x_m}{\partial z_m} N_k + o(\rho) \right. \right| + \\ &\quad + \alpha_1 \Delta x_1 + \alpha_2 \Delta x_2 + \dots + \alpha_m \Delta x_m = \\ &= \left[ \frac{\partial f}{\partial x_1} \frac{\partial x_1}{\partial t_1} + \frac{\partial f}{\partial x_2} \frac{\partial x_2}{\partial t_1} + \dots + \frac{\partial f}{\partial x_m} \frac{\partial x_m}{\partial t_1} \right] N_1 + \\ &\quad \cdot \left[ \frac{\partial f}{\partial x_1} \frac{\partial x_1}{\partial t_2} + \frac{\partial f}{\partial x_2} \frac{\partial x_2}{\partial t_2} + \dots + \frac{\partial f}{\partial x_m} \frac{\partial x_m}{\partial t_2} \right] N_2 + \end{aligned}$$

$$+ \dots +$$

$$+ \left[ \frac{\partial f}{\partial x_1} \frac{\partial x_1}{\partial t_k} + \frac{\partial f}{\partial x_2} \frac{\partial x_2}{\partial t_k} + \dots + \frac{\partial f}{\partial x_m} \frac{\partial x_m}{\partial t_k} \right] \Delta t_k +$$

$$+ \left[ \frac{\partial f}{\partial x_1} + \frac{\partial f}{\partial x_2} + \dots + \frac{\partial f}{\partial x_m} \right] o(\rho) +$$

$$+ \alpha_1 \Delta x_1 + \alpha_2 \Delta x_2 + \dots + \alpha_m \Delta x_m.$$
(13.12)

Bu tenglikdagagi  $\left[ \frac{\partial f}{\partial x_1} + \frac{\partial f}{\partial x_2} + \dots + \frac{\partial f}{\partial x_m} \right]$  yig'indi o'zgarmas ( $\rho$  ga bog'liq emas) bo'lganligi sahabli

$$\left[ \frac{\partial f}{\partial x_1} + \frac{\partial f}{\partial x_2} + \dots + \frac{\partial f}{\partial x_m} \right] o(\rho) = o(\rho) \quad (13.13)$$

bo'ladi.

Modomiki,  $x_i = \varphi_i(t_1, t_2, \dots, t_k)$  ( $i = 1, 2, \dots, m$ ) funksiyalar  $(t_1^0, t_2^0, \dots, t_k^0)$  nuqtada differensiallanuvchi ekan, ular shu nuqtada uzlusiz bo'ladi. Unda uzlusizsizlik tarisiga ko'ra  $\Delta t_1 \rightarrow 0, \Delta t_2 \rightarrow 0, \dots, \Delta t_k \rightarrow 0$  da, ya'ni  $\rho \rightarrow 0$  da  $\Delta x_1 \rightarrow 0, \Delta x_2 \rightarrow 0, \dots, \Delta x_m \rightarrow 0$  bo'ladi. Yana ham aniqroq aysak, (13.10) formuladan  $\rho \rightarrow 0$  da  $\Delta x_1 = o(\rho), \Delta x_2 = o(\rho), \dots, \Delta x_m = o(\rho)$  ekanligi kelib chiqadi.  $\Delta x_1 \rightarrow 0, \Delta x_2 \rightarrow 0, \dots, \Delta x_m \rightarrow 0$  da esa  $\alpha_1 \rightarrow 0, \alpha_2 \rightarrow 0, \dots, \alpha_m \rightarrow 0$ .

Demak,

$$\rho \rightarrow 0 \Rightarrow \text{barcha } \Delta x_i \rightarrow 0 \Rightarrow \text{barcha } \alpha_i \rightarrow 0 \Rightarrow \alpha_1 \Delta x_1, \alpha_2 \Delta x_2, \dots, \alpha_m \Delta x_m = o(\rho) \quad (13.14)$$

Agar

$$A_j = \frac{\partial f}{\partial x_1} \frac{\partial x_1}{\partial t_j} + \frac{\partial f}{\partial x_2} \frac{\partial x_2}{\partial t_j} + \dots + \frac{\partial f}{\partial x_m} \frac{\partial x_m}{\partial t_j}$$

( $j = 1, 2, 3, \dots, k$ ) deyilsa, u holda (13.12), (13.13) va (13.14) munosabatlardan

$$\Delta f = A_1 \Delta t_1 + A_2 \Delta t_2 + \dots + A_k \Delta t_k + o(\rho)$$

kelib chiqadi. ▶

**2º. Murakkab funksiyaning hosilasi.** Endi

$$f(\varphi_1(t_1, t_2, \dots, t_k), \varphi_2(t_1, t_2, \dots, t_k), \dots, \varphi_m(t_1, t_2, \dots, t_k)) = F(t_1, t_2, \dots, t_k)$$

murakkab funksiyaning  $t_1, t_2, \dots, t_k$  o'zgaruvchilar bo'yicha xususiy hosilalarini topamiz. Aytaylik,  $f(x_1, x_2, \dots, x_m)$  va  $x_1 = \varphi_1(t_1, t_2, \dots, t_k), x_2 = \varphi_2(t_1, t_2, \dots, t_k), \dots, x_m = \varphi_m(t_1, t_2, \dots, t_k)$  funksiyalar yuqoridaagi 5-teoremaning shartlarini bajarsin. U holda 5-teoremaga ko'ra murakkab funksiya  $(t_1^0, t_2^0, \dots, t_k^0)$  nuqtada differensiallanuvchi bo'ladi.

Demak, bir tomondan

$$\Delta f = A_1 \Delta t_1 + A_2 \Delta t_2 + \dots + A_k \Delta t_k + o(\rho) \quad (13.15)$$

bo'lib, bunda

$$A_j = \frac{\partial f}{\partial x_1} \frac{\partial x_1}{\partial t_j} + \frac{\partial f}{\partial x_2} \frac{\partial x_2}{\partial t_j} + \dots + \frac{\partial f}{\partial x_m} \frac{\partial x_m}{\partial t_j} \quad (j = 1, 2, \dots, k) \quad (13.16)$$

(qaralsin 5-teorema) ikkinchi tamondan 1-natijaga asosan

$$\Delta f = \frac{\partial f}{\partial x_1} \Delta x_1 + \frac{\partial f}{\partial x_2} \Delta x_2 + \dots + \frac{\partial f}{\partial x_k} \Delta x_k + o(\rho) \quad (13.17)$$

bo'ladi. (13.15), (13.16) va (13.17) va munosabatlardan

$$\frac{\partial f}{\partial x_1} = \frac{\partial f}{\partial x_1} \frac{\partial x_1}{\partial t_1} + \frac{\partial f}{\partial x_2} \frac{\partial x_1}{\partial t_1} + \dots + \frac{\partial f}{\partial x_m} \frac{\partial x_1}{\partial t_1}$$

$$\frac{\partial f}{\partial x_2} = \frac{\partial f}{\partial x_1} \frac{\partial x_2}{\partial t_2} + \frac{\partial f}{\partial x_2} \frac{\partial x_2}{\partial t_2} + \dots + \frac{\partial f}{\partial x_m} \frac{\partial x_2}{\partial t_2}$$

$$\frac{\partial f}{\partial x_k} = \frac{\partial f}{\partial x_1} \frac{\partial x_k}{\partial t_k} + \frac{\partial f}{\partial x_2} \frac{\partial x_k}{\partial t_k} + \dots + \frac{\partial f}{\partial x_m} \frac{\partial x_k}{\partial t_k}$$

bo'lishini topamiz.

### 5-§. Ko'p o'zgaruvchili funksiyaning differensiali

**Iº. Funksiya differentialining ta'rifi.**  $f(x_1, x_2, \dots, x_m)$  funksiya ochiq  $M (M \subset R^m)$  to'plamida berilgan bo'lib, bu to'plamning  $x^0 = (x_1^0, x_2^0, \dots, x_m^0)$  nuqtasida differentiallanuvchi bo'lsin. Ta'rifga ko'ra  $f(x)$  funksiyaning  $x^0$  nuqtadagi orttirmasi

$$\Delta f = \frac{\partial f(x^0)}{\partial x_1} \Delta x_1 + \frac{\partial f(x^0)}{\partial x_2} \Delta x_2 + \dots + \frac{\partial f(x^0)}{\partial x_m} \Delta x_m + \alpha_1 \Delta x_1 + \alpha_2 \Delta x_2 + \dots + \alpha_m \Delta x_m$$

bo'ladi.

**4-ta'rif.**  $f(x_1, x_2, \dots, x_m)$  funksiya orttirmasi  $\Delta f(x^0)$  ning  $\Delta x_1, \Delta x_2, \dots, \Delta x_m$  larga nisbatan chiziqli bos qismi

$$\frac{\partial f(x^0)}{\partial x_1} \Delta x_1 + \frac{\partial f(x^0)}{\partial x_2} \Delta x_2 + \dots + \frac{\partial f(x^0)}{\partial x_m} \Delta x_m$$

$f(x)$  funksiyaning  $x^0$  nuqtadagi differensiali (to'liq differensiali) deb ataladi va  $d f(x^0, x_1^0, x_2^0, \dots, x_m^0)$  kabi belgilanadi. Demak,

$$d f(x^0) = d f(x_1^0, x_2^0, \dots, x_m^0) = \frac{\partial f(x^0)}{\partial x_1} \Delta x_1 + \frac{\partial f(x^0)}{\partial x_m} \Delta x_m + \dots + \frac{\partial f(x^0)}{\partial x_m} \Delta x_m$$

Agar  $x_1, x_2, \dots, x_m$  erkli o'zgaruvchilarning ixtiyoriy orttirmalari  $\Delta x_1, \Delta x_2, \dots, \Delta x_m$  lar mos ravishda bu o'zgaruvchilarning differensialari  $dx_1, dx_2, \dots, dx_m$  ga teng ekanligini e'tiborga olsak, unda  $f(x)$  funksiyaning differensiali quyidagi

$$d f(x^0) = \frac{\partial f(x^0)}{\partial x_1} dx_1 + \frac{\partial f(x^0)}{\partial x_2} dx_2 + \dots + \frac{\partial f(x^0)}{\partial x_m} dx_m \quad (13.18)$$

ko'rinishiga keladi.

Odatda  $\frac{\partial f}{\partial x_1} dx_1, \frac{\partial f}{\partial x_2} dx_2, \dots, \frac{\partial f}{\partial x_m} dx_m$  lar  $f(x_1, x_2, \dots, x_m)$  funksiya xususiy differensiallari deb ataladi va ular mos ravishda  $d_{x_1} f, d_{x_2} f, \dots, d_{x_m} f$  kabi belgilanadi:

$$d_{x_1} f = \frac{\partial f}{\partial x_1} dx_1, d_{x_2} f = \frac{\partial f}{\partial x_2} dx_2, \dots, d_{x_m} f = \frac{\partial f}{\partial x_m} dx_m.$$

Demak,  $f(x)$  funksiyaning  $x^0$  nuqtadagi differensiali, uning shu nuqtadagi xususiy differensiallari yig'indisidan iborat. Masalan, ushbu

$$f(x_1, x_2) = e^{x_1 \sin x_2}$$

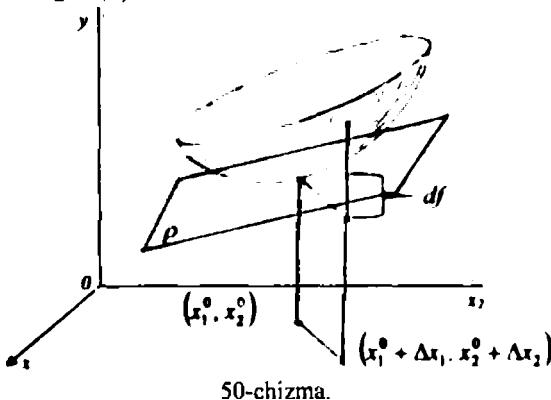

funksiyaning  $\forall (x_1, x_2) \in R^2$  nuqtadagi differensiali

$$\begin{aligned} df &= \frac{\partial f}{\partial x_1} dx_1 + \frac{\partial f}{\partial x_2} dx_2 = \sin x_2 e^{x_1 \sin x_2} dx_1 + x_1 \cos x_2 e^{x_1 \sin x_2} dx_2 = \\ &= e^{x_1 \sin x_2} (\sin x_2 dx_1 + x_1 \cos x_2 dx_2) \end{aligned}$$

bo'ladi.

Endi funksiya differensialining geometrik ma'nosini ikki o'zgaruvchili funksiya uchun keltiramiz.

Aytaylik,  $y = f(x_1, x_2)$  funksiya ochiq  $M$  to'plamida ( $M \subset R^2$ ) berilgan bo'lib,  $(x_1^0, x_2^0) \in M$  nuqtada differensiallanuvchi bo'lisin. Bu funksiyaning grafigi 50-chizmada tasvirlangan ( $S$ ) sirtni ifodalasın.

50-chizma.

( $S$ ) sirtga  $(x_1^0, x_2^0, y_0)$  nuqtasida  $(y_0 = f(x_1^0, x_2^0))$  o'tkazilgan urinma tekislik ushbu

$$y - y_0 = \frac{\partial f(x_1^0, x_2^0)}{\partial x_1} (x_1 - x_1^0) + \frac{\partial f(x_1^0, x_2^0)}{\partial x_2} (x_2 - x_2^0)$$

ko'rinishda bo'lib, undan

$$y - y_0 = df(x_1^0, x_2^0)$$

ekanligi kelib chiqadi. Demak,  $y = f(x_1, x_2)$  funksiyaning  $(x_1^0, x_2^0)$  nuqtadagi differensiali bu funksiya grafigiga  $(x_1^0, x_2^0, f(x_1^0, x_2^0))$  nuqtasida o'tkazilgan urinma tekislik aplikatasining orttirmasidan iborat ekan.

**2. Murakkab funksiyaning differensiali.**  $y = f(x_1, x_2, \dots, x_m)$  funksiya  $M (M \subset R^m)$  to'plamda berilgan bo'lib.  $x_1, x_2, \dots, x_m$  o'zgaruvchilarning har biri o'z navbatida  $t_1, t_2, \dots, t_k$  o'zgaruvchilarning  $T (T \subset R^k)$  to'plamda berilgan funk-siyasi bo'lsin:

$$x_1 = \varphi_1(t_1, t_2, \dots, t_k),$$

$$x_2 = \varphi_2(t_1, t_2, \dots, t_k),$$

$$\dots \dots \dots$$

$$x_m = \varphi_m(t_1, t_2, \dots, t_k).$$

Bunda  $(t_1, t_2, \dots, t_k) \in T$  bo'lganda unga mos  $(x_1, x_2, \dots, x_m) \in M$  bo'lib, ushbu  $y = f(\varphi_1(t_1, t_2, \dots, t_k), \varphi_2(t_1, t_2, \dots, t_k), \dots, \varphi_m(t_1, t_2, \dots, t_k))$

murakkab funksiya tuzilgan bo'lsin.

Faraz qitaylik  $x_i = \varphi_i(t_1, t_2, \dots, t_k)$  ( $i = 1, 2, \dots, m$ ) funksiyalarning har biri  $(t_1^0, t_2^0, \dots, t_k^0) \in T$  nuqtada differensiallanuvchi bo'lib.  $y = f(x_1, x_2, \dots, x_m)$  funksiya esa mos  $(x_1^0, x_2^0, \dots, x_m^0) \in M$  nuqtada differensiallanuvchi bo'lsin. U holda 5-teore-maga ko'ra murakkab funksiya  $(t_1^0, t_2^0, \dots, t_k^0)$  nuqtada differensiallanuvchi bo'ladi. Unda murakkab funksiyaning shu nuqtadagi differensiali

$$df = \frac{\partial f}{\partial t_1} dt_1 + \frac{\partial f}{\partial t_2} dt_2 + \dots + \frac{\partial f}{\partial t_k} dt_k.$$

bo'ladi.

Ma'lumki.

$$\frac{\partial f}{\partial t_1} = \frac{\partial f}{\partial x_1} \frac{\partial x_1}{\partial t_1} + \frac{\partial f}{\partial x_2} \frac{\partial x_2}{\partial t_1} + \dots + \frac{\partial f}{\partial x_m} \frac{\partial x_m}{\partial t_1},$$

$$\frac{\partial f}{\partial t_2} = \frac{\partial f}{\partial x_1} \frac{\partial x_1}{\partial t_2} + \frac{\partial f}{\partial x_2} \frac{\partial x_2}{\partial t_2} + \dots + \frac{\partial f}{\partial x_m} \frac{\partial x_m}{\partial t_2},$$

$$\dots \dots \dots$$

$$\frac{\partial f}{\partial t_k} = \frac{\partial f}{\partial x_1} \frac{\partial x_1}{\partial t_k} + \frac{\partial f}{\partial x_2} \frac{\partial x_2}{\partial t_k} + \dots + \frac{\partial f}{\partial x_m} \frac{\partial x_m}{\partial t_k}$$

Natijada

$$df = \left( \frac{\partial f}{\partial x_1} \frac{\partial x_1}{\partial t_1} + \frac{\partial f}{\partial x_2} \frac{\partial x_2}{\partial t_1} + \dots + \frac{\partial f}{\partial x_m} \frac{\partial x_m}{\partial t_1} \right) dt_1 +$$

$$+ \left( \frac{\partial f}{\partial x_1} \frac{\partial x_1}{\partial t_2} + \frac{\partial f}{\partial x_2} \frac{\partial x_2}{\partial t_2} + \dots + \frac{\partial f}{\partial x_m} \frac{\partial x_m}{\partial t_2} \right) dt_2 +$$

$$\begin{aligned}
 & + \left( \frac{\partial f}{\partial x_1} \frac{dx_1}{dt_1} + \frac{\partial f}{\partial x_2} \frac{dx_2}{dt_1} + \dots + \frac{\partial f}{\partial x_m} \frac{dx_m}{dt_1} \right) dt_1 = \\
 & = \frac{\partial f}{\partial t_1} \left( \frac{dx_1}{dt_1} dt_1 + \frac{dx_2}{dt_1} dt_1 + \dots + \frac{dx_m}{dt_1} dt_1 \right) + \\
 & + \frac{\partial f}{\partial t_2} \left( \frac{dx_1}{dt_2} dt_2 + \frac{dx_2}{dt_2} dt_2 + \dots + \frac{dx_m}{dt_2} dt_2 \right) + \\
 & \vdots \\
 & + \frac{\partial f}{\partial t_k} \left( \frac{dx_1}{dt_k} dt_k + \frac{dx_2}{dt_k} dt_k + \dots + \frac{dx_m}{dt_k} dt_k \right)
 \end{aligned}$$

bo'ladi.

Agar

$$\frac{dx_1}{dt_1} dt_1 + \frac{dx_2}{dt_1} dt_1 + \dots + \frac{dx_m}{dt_1} dt_1 = dx_1,$$

$$\frac{dx_1}{dt_2} dt_2 + \frac{dx_2}{dt_2} dt_2 + \dots + \frac{dx_m}{dt_2} dt_2 = dx_1,$$

$$\frac{dx_1}{dt_k} dt_k + \frac{dx_2}{dt_k} dt_k + \dots + \frac{dx_m}{dt_k} dt_k = dx_1,$$

ekanligini e'tiborga olsak, u holda murakkab funksiya differensiali uchun

$$df = \frac{\partial f}{\partial x_1} dx_1 + \frac{\partial f}{\partial x_2} dx_2 + \dots + \frac{\partial f}{\partial x_k} dx_k \quad (13.19)$$

bo'lishi kelib chiqadi.

Murakkab funksiya differensiali ifodalovchi (13.19) formulani avval qarab o'tilgan (13.18) formula bilan solishtirib bir xil formaga ega bo'lishini (ya'ni differensial formasi saqlanishni) ko'ramiz. Odadta bu xossani differensial formasining (shaklining) invariantligi deyiladi.

Demak, ko'p o'zgaruvchili funksiyalarda ham bir o'zgaruvchili funksiyalar-dagidek, differensial shaklining invariantligi xossasi o'rinnli ekan.

Shuni alohida ta'kidlash lozimki, (13.19) ifoda  $dx_1, dx_2, \dots, dx_m$  lar  $x_1, x_2, \dots, x_m$  larning ixtiyoriy orttirmalari  $\Delta x_1, \Delta x_2, \dots, \Delta x_m$  tar bo'lmasdan, ular  $t_1, t_2, \dots, t_k$  o'zgaruvchilarining funksiyalari bo'ladi.

**3°. Funksiya differensiali hisoblashning sodda qoidatari.**  $u = f(x)$  va  $v = g(x)$  funksiyalar ochiq  $M$  ( $M \subset R^n$ ) to'plamida berilgan bo'lib,  $x^0 \in M$  nuqtada ular differensiallanuvchi bo'lsin. U holda  $u \pm v$ ,  $uv$ ,  $\frac{u}{v}$ , ( $v \neq 0$ ) funksiyalar ham shu  $x^0$  nuqtada differensiallanuvchi bo'ladi va ularning differensiallari uchun quyidagi

- 1)  $d(u \pm v) = du \pm dv$ ,
- 2)  $d(uv) = udv + vdu$ ,
- 3)  $d\left(\frac{u}{v}\right) = \frac{vdu - udv}{v^2} \quad (v \neq 0)$

formula o'rini bo'ladi.

Bu munosabatlardan birining, masalan, 2) ning isbotini keltirish bilan chegaralanamiz.

$u = f(x)$  va  $v = g(x)$  funksiyalar ko'paytmasini  $F$  funksiya deb qaraylik:  $F = u \cdot v$ . Natijada  $F$  funksiya  $u$  va  $v$  lar orqali  $x_1, x_2, \dots, x_m$  o'zgaruvchilarning ( $x = (x_1, x_2, \dots, x_m)$ ) murakkab funksiya bo'ladi. Murakkab funksiyaning differensialini topish formulasini (13.19) ga ko'ra

$$dF = \frac{\partial F}{\partial u} du + \frac{\partial F}{\partial v} dv$$

bo'ladi.

Agar

$$\frac{\partial F}{\partial u} = v \quad \frac{\partial F}{\partial v} = u$$

ekanligini e'tiborga olsak, unda

$$dF = vdu + udv$$

bo'lishini topamiz. Demak,

$$d(uv) = vdu + udv.$$

### 6-§. Ko'p o'zgaruvchili funksiyaning yuqori tartibili hosila va differensiallari

**I.** *Funksiyaning yuqori tartibili xususiy hosilalari.*  $f(x_1, x_2, \dots, x_m)$  funksiya ochiq  $M (M \subset R^m)$  to'plamda berilgan bo'lib, uning har bir  $(x_1, x_2, \dots, x_m)$  nuqtasida  $f'_{x_1}, f'_{x_2}, \dots, f'_{x_m}$  xususiy hosilalarga ega bo'lsin. Ravshanki, bu xususiy hosilalar o'z navbatida  $x_1, x_2, \dots, x_m$  o'zgaruvchilarga bog'liq bo'lib, ularning funksiyalari bo'lib qolishi mumkin. Berilgan funksiya xususiy hosilalari  $f'_{x_1}, f'_{x_2}, \dots, f'_{x_m}$  larning ham xususiy hosilalarini qarash mumkin.

**S-ta'rif.**  $f(x_1, x_2, \dots, x_m)$  funksiya xususiy hosilalari  $f'_{x_1}, f'_{x_2}, \dots, f'_{x_m}$  larning  $x_k$  ( $k = 1, 2, \dots, m$ ) o'zgaruvchi bo'yicha xususiy hosilalari berilgan funksiyaning ikkinchi tartibili xususiy hosilalari deb ataladi va

$$f''_{x_1 x_k}, f''_{x_2 x_k}, \dots, f''_{x_m x_k} \quad (k = 1, 2, \dots, m)$$

yoki

$$\frac{\partial^2 f}{\partial x_1 \partial x_k}, \frac{\partial^2 f}{\partial x_2 \partial x_k}, \dots, \frac{\partial^2 f}{\partial x_m \partial x_k} \quad (k = 1, 2, \dots, m)$$

kabi belgilanadi. Demak,

$$\frac{\partial^2 f}{\partial x_i \partial x_k} = f''_{x_i x_k} = \frac{\partial}{\partial x_k} \left( \frac{\partial f}{\partial x_i} \right).$$

$$\frac{\partial^2 f}{\partial x_k \partial x_i} = f''_{x_k x_i} = \frac{\partial}{\partial x_i} \left( \frac{\partial f}{\partial x_k} \right).$$

$$\frac{\partial^2 f}{\partial x_m \partial x_k} = f''_{x_m x_k} = \frac{\partial}{\partial x_k} \left( \frac{\partial f}{\partial x_m} \right) \quad (k = 1, 2, \dots, m)$$

Bu ikkinchi tartibli xususiy hosilalarni umumiy holda

$$\frac{\partial^2 f}{\partial x_i \partial x_k} = f''_{x_i x_k} \quad (i = 1, 2, \dots, m, k = 1, 2, \dots, m)$$

ko'rinishda yozish mumkin, bunda  $k = i$  bo'lganda

$$\frac{\partial^2 f}{\partial x_i \partial x_i} = f''_{x_i x_i}$$

deb yozish o'miga

$$\frac{\partial^2 f}{\partial x_i^2} = f''_{x_i x_i}$$

deb yoziladi.

Agar yuqoridagi ikkinchi tartibli xususiy hosilalar turli o'zgaruvchilar bo'yicha olingen bo'lsa, unda bu

$$\frac{\partial^2 f}{\partial x_i \partial x_k} = f''_{x_i x_k} \quad (i \neq k)$$

2-tartibli xususiy hosilalar aralash hosilalar deb ataladi.

Xuddi shunga o'xshash,  $f(x_1, x_2, \dots, x_m)$  funksiyaning uchinchi, to'rtinchi va xokazo tartibdagi xususiy hosilalari ta'riflanadi. Umuman,  $f(x_1, x_2, \dots, x_m)$  funksiya  $(n-1)$ -tartibli xususiy hosilalarning xususiy hosilasi berilgan funksiyaning  $n$ -tartibli xususiy hosilasi deb ataladi.

### 13.6-misol. Ushbu

$$f(x_1, x_2) = \operatorname{arctg} \frac{x_1}{x_2} \quad (x_2 \neq 0)$$

funksiyaning 2-tartibli xususiy hosilasi topilsin.

$$\blacktriangleleft \text{ Ravshanki, } \frac{\partial f}{\partial x_1} = \frac{x_2}{x_1^2 + x_2^2}, \quad \frac{\partial f}{\partial x_2} = -\frac{x_1}{x_1^2 + x_2^2}.$$

$$\frac{\partial^2 f}{\partial x_1^2} = \frac{\partial}{\partial x_1} \left( \frac{\partial f}{\partial x_1} \right) = \frac{\partial}{\partial x_1} \left( \frac{x_2}{x_1^2 + x_2^2} \right) = -\frac{2x_1 x_2}{(x_1^2 + x_2^2)^2}.$$

$$\frac{\partial^2 f}{\partial x_1 \partial x_2} = \frac{\partial}{\partial x_2} \left( \frac{\partial f}{\partial x_1} \right) = \frac{\partial}{\partial x_2} \left( \frac{x_2}{x_1^2 + x_2^2} \right) = \frac{x_1^2 - x_2^2}{(x_1^2 + x_2^2)^2},$$

$$\frac{\partial^2 f}{\partial x_1 \partial x_2} = \frac{\partial}{\partial x_1} \left( \frac{\partial f}{\partial x_2} \right) = \frac{\partial}{\partial x_1} \left( -\frac{x_1}{x_1^2 + x_2^2} \right) = \frac{x_1^2 - x_2^2}{(x_1^2 + x_2^2)^2}.$$

$$\frac{\partial^2 f}{\partial x_2 \partial x_1} = \frac{\partial}{\partial x_2} \left( \frac{\partial f}{\partial x_1} \right) = \frac{\partial}{\partial x_2} \left( -\frac{x_1}{x_1^2 + x_2^2} \right) = \frac{2x_1 x_2}{(x_1^2 + x_2^2)^2}.$$

**13.7-misol.** Ushbu

$$f(x_1, x_2) = \begin{cases} x_1 x_2 \frac{x_1^2 - x_2^2}{x_1^2 + x_2^2}, & \text{agar } x_1^2 + x_2^2 \neq 0 \text{ bo'lsa,} \\ 0 & \text{agar } x_1^2 + x_2^2 = 0 \text{ bo'lsa} \end{cases}$$

funksiyaning aralash hosilalari topilsin.

◀ Aytaylik  $(x_1, x_2) \neq (0, 0)$  bo'lsin. U holda

$$\frac{\partial f}{\partial x_1} = x_2 \left( \frac{x_1^2 - x_2^2}{x_1^2 + x_2^2} + \frac{4x_1^2 x_2^2}{(x_1^2 + x_2^2)^2} \right), \quad \frac{\partial f}{\partial x_2} = x_1 \left( \frac{x_1^2 - x_2^2}{x_1^2 + x_2^2} - \frac{4x_1^2 x_2^2}{(x_1^2 + x_2^2)^2} \right).$$

$$\frac{\partial^2 f}{\partial x_1 \partial x_2} = \frac{\partial}{\partial x_2} \left( \frac{\partial f}{\partial x_1} \right) = \frac{x_1^2 - x_2^2}{x_1^2 + x_2^2} \left( 1 + \frac{8x_1^2 x_2^2}{(x_1^2 + x_2^2)^2} \right).$$

$$\frac{\partial^2 f}{\partial x_2 \partial x_1} = \frac{\partial}{\partial x_1} \left( \frac{\partial f}{\partial x_2} \right) = \frac{x_1^2 - x_2^2}{x_1^2 + x_2^2} \left( 1 + \frac{8x_1^2 x_2^2}{(x_1^2 + x_2^2)^2} \right)$$

bo'ladi.

Berilgan  $f(x_1, x_2)$  funksiyaning  $(0, 0)$  nuqtadagi xususiy hosilalarini ta'rifga ko'ra topamiz:

$$\frac{\partial f(0, 0)}{\partial x_1} = \lim_{\Delta x_1 \rightarrow 0} \frac{f(\Delta x_1, 0) - f(0, 0)}{\Delta x_1} = 0.$$

$$\frac{\partial f(0, 0)}{\partial x_2} = \lim_{\Delta x_2 \rightarrow 0} \frac{f(0, \Delta x_2) - f(0, 0)}{\Delta x_2} = 0.$$

$$\frac{\partial^2 f(0, 0)}{\partial x_1 \partial x_2} = \lim_{\Delta x_1 \rightarrow 0} \frac{\frac{\partial f(0, \Delta x_2)}{\partial x_2} - \frac{\partial f(0, 0)}{\partial x_2}}{\Delta x_2} = \lim_{\Delta x_1 \rightarrow 0} \frac{-\Delta x_2}{\Delta x_2^2} = -1.$$

$$\frac{\partial^2 f(0, 0)}{\partial x_2 \partial x_1} = \lim_{\Delta x_2 \rightarrow 0} \frac{\frac{\partial f(\Delta x_1, 0)}{\partial x_1} - \frac{\partial f(0, 0)}{\partial x_1}}{\Delta x_1} = \lim_{\Delta x_2 \rightarrow 0} \frac{\Delta x_1^3}{\Delta x_1^2} = 1.$$

Bu keltirilgan misollar ko'rindiki, funksiyaning  $\frac{\partial^2 f}{\partial x_1 \partial x_2}$  va  $\frac{\partial^2 f}{\partial x_2 \partial x_1}$  aralash hosilalari bir-biriga teng bo'lishi ham, teng bo'lmasligi ham mumkin ekan.

**6-teorema**  $f(x_1, x_2)$  funksiya ochiq  $M (M \subset R^2)$  to'plamda  $f'_1, f'_2$ , hamda  $f''_{x_1 x_2}, f''_{x_2 x_1}$  aralash hosilalarga ega bo'lsin. Agar aralash hosilalar  $(x_1^n, x_2^n) \in M$  nuqtada uzluksiz bo'lsa, u holda shu nuqtada

$$f''_{x_1 x_2}(x_1^0, x_2^0) = f''_{x_2 x_1}(x_1^0, x_2^0)$$

bo'ldi.

$\Delta(x_1^0, x_2^0)$  nuqta koordinatalariga mos ravishda shunday  $\Delta x_1 > 0$ .  $\Delta x_2 > 0$  orttirmalar beraylikki,

$$D = \{(x_1, x_2) \in R^2 : x_1^0 \leq x_1 \leq x_1^0 + \Delta x_1, x_2^0 \leq x_2 \leq x_2^0 + \Delta x_2\} \subset M$$

bo'lsin. Bu to'g'ri to'rtburchak uchlarini ifodalovchi  $(x_1^0, x_2^0)$ ,  $(x_1^0 + \Delta x_1, x_2^0)$ ,  $(x_1^0, x_2^0 + \Delta x_2)$ ,  $(x_1^0 + \Delta x_1, x_2^0 + \Delta x_2)$  nuqtalarda funksiyaning qiymatlarini topib ulardan ushbu

$$P = f(x_1^0 + \Delta x_1, x_2^0 + \Delta x_2) - f(x_1^0 + \Delta x_1, x_2^0) - f(x_1^0, x_2^0 + \Delta x_2) + f(x_1^0, x_2^0)$$

ifodani hosil qilamiz. Bu ifodani quyidagi ikki

$$P = [f(x_1^0 + \Delta x_1, x_2^0 + \Delta x_2) - f(x_1^0 + \Delta x_1, x_2^0)] - [f(x_1^0, x_2^0 + \Delta x_2) - f(x_1^0, x_2^0)]$$

$$P = [f(x_1^0 + \Delta x_1, x_2^0 + \Delta x_2) - f(x_1^0, x_2^0 + \Delta x_2)] - [f(x_1^0 + \Delta x_1, x_2^0) - f(x_1^0, x_2^0)]$$

ko'rinishda yozish mumkin.

Endi berilgan  $f(x_1, x_2)$  funksiya yordamida  $x_1$  o'zgaruvchiga bog'liq bo'lgan

$$\varphi(x_1) = f(x_1, x_2^0 + \Delta x_2) - f(x_1, x_2^0),$$

$x_2$  o'zgaruvchiga bog'liq bo'lgan

$$\psi(x_2) = f(x_1^0 + \Delta x_1, x_2) - f'_1(x_1^0, x_2)$$

funksiyalarni tuzaylik. Ravshanki,  $\varphi(x_1)$ ,  $\psi(x_2)$  funksiyalar

$$\varphi'(x_1) = f'_{x_1}(x_1, x_2^0 + \Delta x_2) - f'_{x_1}(x_1, x_2^0),$$

$$\psi'(x_2) = f'_{x_2}(x_1^0 + \Delta x_1, x_2) - f'_{x_2}(x_1^0, x_2)$$

hosilalarga ega bo'llib, Lagranj teoremasiga asosan

$$\varphi'(x_1) = f''_{x_1 x_2}(x_1^0, x_2^0 + \theta_2 \Delta x_2) \cdot \Delta x_2, \quad (13.20)$$

$$\psi'(x_2) = f''_{x_2 x_1}(x_1^0 + \theta_1 \Delta x_1, x_2) \cdot \Delta x_1$$

bo'ldi, bunda  $0 < \theta_1, \theta_2 < 1$ .

Yuqorida keltirilgan  $P$  ifodani  $\varphi(x_1)$ ,  $\psi(x_2)$  funksiyalar orqali ushbu

$$P = \varphi(x_1^0 + \Delta x_1) - \varphi(x_1^0)$$

$$P = \psi(x_2^0 + \Delta x_2) - \psi(x_2^0)$$

ko'rinishda yozib, so'ng yana Lagranj teoremasini qo'llab quyidagilarni topamiz:

$$P = \varphi'(x_1^0 + \theta_1 \Delta x_1) \cdot \Delta x_1, \quad P = \psi'(x_2^0 + \theta_2 \Delta x_2) \cdot \Delta x_2 \quad (13.21)$$

$$(0 < \theta_1, \theta_2 < 1)$$

Natijada (13.20) va (13.21) munosabatlardan

$$P = f''_{x_1 x_2}(x_1^0 + \theta_1 \Delta x_1, x_2^0 + \theta_2 \Delta x_2) \cdot \Delta x_1 \Delta x_2$$

$$P = f''_{x_2 x_1}(x_1^0 + \theta_1 \Delta x_1, x_2^0 + \theta_2 \Delta x_2) \cdot \Delta x_1 \Delta x_2$$

bo'lib, ulardan esa

$$f_{x_1, x_2}^*(x_1^0 + \theta_1' \Delta x_1, x_2^0 + \theta_2' \Delta x_2) = f_{x_1, x_2}^*(x_1^0 + \theta_1 \Delta x_1, x_2^0 + \theta_2' \Delta x_2) \quad (13.22)$$

bo'lishi kelib chiqadi.

Shartga ko'ra  $f_{x_1, x_2}^*$ , va  $f_{x_1, x_2}^*$  aralash hosilalar  $(x_1^0, x_2^0)$  nuqtada uzluksiz. Shuning uchun (13.22) da  $\Delta x_1 \rightarrow 0$ ,  $\Delta x_2 \rightarrow 0$  limitga o'tsak,

$$f_{x_1, x_2}^*(x_1^0, x_2^0) = f_{x_1, x_2}^*(x_1^0, x_2^0)$$

bo'ladi. ▶

**2°. Funksiyaning yuqori tartibli differensiallari.** Ko'p o'zgaruvchili funksiyaning yuqori tartibli differensiali tushunchasi keltirishdan avval, funksiyaning  $n$  ( $n > 1$ ) marta differensiallanuvchiligi tushunchasi bilan tanishamiz.

$f(x)$  funksiya ochiq  $M$  ( $M \subset R^n$ ) to'plamda berilgan bo'lib,  $x^0 \in M$  bo'lsin. Ma'lumki,  $f(x)$  funksiyaning  $x^0$  nuqtadagi ortirmasi ushbu

$$\Lambda f(x^0) = A_1 \Delta x_1 + A_2 \Delta x_2 + \dots + A_m \Delta x_m + o(\rho)$$

ko'rinishda ifodalansa, funksiya  $x^0$  nuqtada differensiallanuvchi deb atalar edi, bunda  $A_1, A_2, \dots, A_m$  - o'zgarmas sonlar,  $\rho = \sqrt{\Delta x_1^2 + \Delta x_2^2 + \dots + \Delta x_m^2}$ . Bu holda ko'rigan edikki,

$$A_i = \frac{\partial f(x^0)}{\partial x_i} \quad (i = 1, 2, \dots, m)$$

Aytaylik,  $f(x)$  funksiya  $M$  to'plamda  $f'_{x_1}, f'_{x_2}, \dots, f'_{x_n}$  xususiy hosilalarga ega bo'lsin. Agar bu xususiy hosilalar  $x^0$  nuqtada differensiallanuvchi bo'lsa,  $f(x)$  shu nuqtada ikki marta differensiallanuvchi funksiya deb ataladi.

Umuman,  $f(x)$  funksiya  $M$  to'plamda barcha  $(n-1)$ -tartibli xususiy hosilalarga ega bo'lib, bu xususiy hosilalar  $x^0 \in M$  nuqtada differensiallanuvchi bo'lsa,  $f(x)$  funksiya  $x^0$  nuqtada  $n$  marta differensiallanuvchi deyiladi.

**7-teorema.**  $f(x)$  funksiya  $M$  to'plamda barcha  $n$ -tartibli xususiy hosilalarga ega bo'lib, bu xususiy hosilalar  $x^0 \in M$  nuqtada uzluksiz bo'lsa,  $f(x)$  funksiya  $x^0$  nuqtada  $n$  marta differensiallanuvchi bo'ladi.

Bu teorema funksiya differensiallanuvchi bo'lishining yetarli shartini ifodalovchi 3-teoremaning isbotlanganligi kabi isbotlanadi.

$f(x)$  funksiya  $x \in M$  nuqtada ikki marta differensiallanuvchi bo'lsin.

**6-ta'rif.**  $f(x)$  funksiyaning  $x$  nuqtadagi differensiali  $df(x)$  ning differensiali berilgan  $f(x)$  funksiyaning ikkinchi tartibli differensiali deb ataladi va u  $d^2 f$  kabi belgilanadi:

$$d^2 f = d(df).$$

Differensiallash qoidalaridan foydalanimiz topamiz:

$$\begin{aligned}
d^2 f = d(df) &= d\left(\frac{\partial f}{\partial x_1} dx_1 + \frac{\partial f}{\partial x_2} dx_2 + \dots + \frac{\partial f}{\partial x_n} dx_n\right) \\
&= dx_1 d\left(\frac{\partial f}{\partial x_1}\right) + dx_2 d\left(\frac{\partial f}{\partial x_2}\right) + \dots + dx_n d\left(\frac{\partial f}{\partial x_n}\right) = \\
&= \left( \frac{\partial^2 f}{\partial x_1^2} dx_1 + \frac{\partial^2 f}{\partial x_1 \partial x_2} dx_2 + \dots + \frac{\partial^2 f}{\partial x_1 \partial x_n} dx_n \right) dx_1 + \\
&+ \left( \frac{\partial^2 f}{\partial x_2 \partial x_1} dx_1 + \frac{\partial^2 f}{\partial x_2^2} dx_2 + \dots + \frac{\partial^2 f}{\partial x_2 \partial x_n} dx_n \right) dx_2 + \\
&\quad \vdots \\
&+ \left( \frac{\partial^2 f}{\partial x_n \partial x_1} dx_1 + \frac{\partial^2 f}{\partial x_n \partial x_2} dx_2 + \dots + \frac{\partial^2 f}{\partial x_n^2} dx_n \right) dx_n + \\
&+ \frac{\partial^2 f}{\partial x_1^2} dx_1^2 + \frac{\partial^2 f}{\partial x_2^2} dx_2^2 + \dots + \frac{\partial^2 f}{\partial x_n^2} dx_n^2 + \\
&+ 2 \frac{\partial^2 f}{\partial x_1 \partial x_2} dx_1 dx_2 + 2 \frac{\partial^2 f}{\partial x_1 \partial x_3} dx_1 dx_3 + \dots + 2 \frac{\partial^2 f}{\partial x_1 \partial x_n} dx_1 dx_n + \\
&+ 2 \frac{\partial^2 f}{\partial x_2 \partial x_1} dx_2 dx_1 + 2 \frac{\partial^2 f}{\partial x_2 \partial x_3} dx_2 dx_3 + \dots + 2 \frac{\partial^2 f}{\partial x_2 \partial x_n} dx_2 dx_n + \\
&+ \dots + 2 \frac{\partial^2 f}{\partial x_{n-1} \partial x_n} dx_{n-1} dx_n.
\end{aligned}$$

$f(x_1, x_2, \dots, x_n)$  funksiyaning  $(x_1, x_2, \dots, x_n)$  nuqtadagi uchinchi, to'rtinchi va yokazo tartibli differensiallari ham xuddi yuqoridaqidek ta'riflanadi.

Umuman,  $f(x)$  funksiyaning  $x$  nuqtadagi  $(n-1)$ - tartibli differensiali  $d^{(n-1)}f(x)$  ning differensial berilgan  $f(x)$  funksiyaning shu nuqtadagi  $n$  tartibli differensiali deb ataladi va  $d^n f$  kabi belgilanadi. Demak,

$$d^n f = d(d^{n-1} f).$$

Biz yuqorida  $f(x)$  funksiyaning ikkinchi tartibli differensiali uning xususiy hosilalari orqali ifodalishini ko'rdik.

$f(x)$  funksiyaning keyingi tartibli differensiallarining funksiya xususiy xosilalari orqali ifodasi borgan sari murakkablasha boradi. Shu sababli yuqori tartibli differensiallarni, simvolik ravishda, soddarroq formada ifodalash muhim.

$f(x)$  funksiya differensiali

$$df = \frac{\partial f}{\partial x_1} dx_1 + \frac{\partial f}{\partial x_2} dx_2 + \dots + \frac{\partial f}{\partial x_n} dx_n$$

ni simvolik ravishda ( $f$  ni formal ravishda qavs tashqarisiga chiqarib) quyidagicha

$$df = \left( \frac{\partial}{\partial x_1} dx_1 + \frac{\partial}{\partial x_2} dx_2 + \dots + \frac{\partial}{\partial x_m} dx_m \right) f$$

yozamiz. Unda funksiyaning ikkinchi tartibli differensialini

$$d^2 f = \left( \frac{\partial}{\partial x_1} dx_1 + \frac{\partial}{\partial x_2} dx_2 + \dots + \frac{\partial}{\partial x_m} dx_m \right)^2 f \quad (13.23)$$

deb qarash mumkin. Bunda qavs ichidagi yig'indi kvadratga ko'tarilib, so'ng  $f$  ga «ko'paytiriladi». Keyin daraja ko'rsatkichlari xususiy hisotilar tartibi deb hisoblanadi.

Shu tarzda kiritilgan simvolik ifodalash  $f(x)$  funksiyaning  $n$ -tartibli differensialini

$$d^n f = \left( \frac{\partial}{\partial x_1} dx_1 + \frac{\partial}{\partial x_2} dx_2 + \dots + \frac{\partial}{\partial x_m} dx_m \right)^n f$$

kabi yozish imkonini beradi.

**3<sup>g</sup>. Murakkab funksiyaning yuqori tartibli differensiallari.** Ushbu punktida  $f(x_1, x_2, \dots, x_m)$ , ( $x_i = \varphi_i(t_1, \dots, t_k)$ ,  $t_1 = \psi_1(t_1, \dots, t_k)$ , ...,  $x_m = \varphi_m(t_1, \dots, t_k)$ ) murakkab funksiyaning yuqori tartibli differensiallarini topamiz.

Ma'lumki,  $x_i = \varphi_i(t_1, t_2, \dots, t_m)$  ( $i = 1, 2, \dots, m$ ) funksiyaning har bir  $(t_1^0, t_2^0, \dots, t_m^0) \in T$  nuqtada differensiallanuvchi bo'llib,  $f(x_1, x_2, \dots, x_m)$  funksiya esa mos  $(x_1^0, x_2^0, \dots, x_m^0)$  nuqtada differensiallanuvchi bo'lsa, u holda 5-teoremaga ko'ra murakkab funksiya  $(t_1^0, t_2^0, \dots, t_k^0)$  nuqtada differensiallanuvchi va differensial shaklining invariantlik xossasiga asosan murakkab funksiyaning differensiali

$$df = \frac{\partial f}{\partial x_1} dx_1 + \frac{\partial f}{\partial x_2} dx_2 + \dots + \frac{\partial f}{\partial x_m} dx_m$$

bo'ladi.

Paraz qilaylik,  $x_i = \varphi_i(t_1, t_2, \dots, t_m)$  ( $i = 1, 2, \dots, m$ ) funksiyalarning har biri  $(t_1^0, t_2^0, \dots, t_m^0) \in T$  nuqtada ikki marta differensiallanuvchi,  $f(x_1, x_2, \dots, x_m)$  funksiya esa mos  $(x_1^0, x_2^0, \dots, x_m^0) \in M$  nuqtada ikki marta differensiallanuvchi bo'tsin. U holda murakkab funksiya ham  $(t_1^0, t_2^0, \dots, t_k^0)$  nuqtada ikki marta differensiallanuvchi bo'ladi. Differensiallash qoidalardidan foydalaniq quyidagini topamiz:

$$\begin{aligned} d^2 f - d(df) &= d\left(\frac{\partial f}{\partial x_1} dx_1 + \frac{\partial f}{\partial x_2} dx_2 + \dots + \frac{\partial f}{\partial x_m} dx_m\right) - d\left(\frac{\partial f}{\partial x_1}\right) dx_1 - \frac{\partial f}{\partial x_1} d(dx_1) + \\ &\cdot d\left(\frac{\partial f}{\partial x_2}\right) dx_2 + \frac{\partial f}{\partial x_2} d(dx_2) + \dots + d\left(\frac{\partial f}{\partial x_m}\right) dx_m + \frac{\partial f}{\partial x_m} d(dx_m) = d\left(\frac{\partial f}{\partial x_1}\right) dx_1 + \\ &\cdot d\left(\frac{\partial f}{\partial x_2}\right) dx_2 + \dots + d\left(\frac{\partial f}{\partial x_m}\right) dx_m + \frac{\partial f}{\partial x_1} d'x_1 + \frac{\partial f}{\partial x_2} d'x_2 + \dots + \frac{\partial f}{\partial x_m} d'x_m = \end{aligned}$$

$$= \left( \frac{\partial}{\partial x_1} dx_1 + \frac{\partial}{\partial x_2} dx_2 + \dots + \frac{\partial}{\partial x_m} dx_m \right)^2 f + \\ + \frac{\partial f}{\partial x_1} d^2 x_1 + \frac{\partial f}{\partial x_2} d^2 x_2 + \dots + \frac{\partial f}{\partial x_m} d^2 x_m \quad (13.24)$$

Shu yo'l bilan berilgan murakkab funksiyaning keyingi tartibdag'i differensiallari topiladi.

(13.23), (13.24) formulalarni solishtirib, ikkinchi tartibli differensiallarda differensial shaklining invariantlig'i xossasi o'rini emasligini ko'ramiz.

**2-eslatma.** Agar

$$x_1 = \alpha_{11}t_1 + \alpha_{12}t_2 + \dots + \alpha_{1k}t_k + \beta_1,$$

$$x_2 = \alpha_{21}t_1 + \alpha_{22}t_2 + \dots + \alpha_{2k}t_k + \beta_2,$$

(13.25)

$$\dots$$

$$x_m = \alpha_{m1}t_1 + \alpha_{m2}t_2 + \dots + \alpha_{mk}t_k + \beta_m$$

bo'lsa ( $\alpha_{ij}$ ,  $\beta_j$  ( $i = 1, 2, \dots, k$ ;  $j = 1, 2, \dots, m$ ) - o'zgarmas sonlar), u holda bunday  $f(x_1, x_2, \dots, x_m)$  murakkab funksiyaning yuqori tartibli differensiallari differensial shaklining invariantlig'i xossasiga ega bo'ladi.

Haqiqatdan ham (13.25) ifodadagi funksiyalarni differensiallasak, unda

$$dx_1 = \alpha_{11}dt_1 + \alpha_{12}dt_2 + \dots + \alpha_{1k}dt_k = \alpha_{11}\Delta t_1 + \alpha_{12}\Delta t_2 + \dots + \alpha_{1k}\Delta t_k,$$

$$dx_2 = \alpha_{21}dt_1 + \alpha_{22}dt_2 + \dots + \alpha_{2k}dt_k = \alpha_{21}\Delta t_1 + \alpha_{22}\Delta t_2 + \dots + \alpha_{2k}\Delta t_k,$$

$$\dots$$

$$dx_m = \alpha_{m1}dt_1 + \alpha_{m2}dt_2 + \dots + \alpha_{mk}dt_k = \alpha_{m1}\Delta t_1 + \alpha_{m2}\Delta t_2 + \dots + \alpha_{mk}\Delta t_k$$

bo'lib  $dx_1, dx_2, \dots, dx_m$  larning har biri  $t_1, t_2, \dots, t_k$  o'zgaruvchilarga bog'liq emasligini ko'ramiz. Ravshanki, bundan  $d^2 x_1 = d_2 x_2 = \dots = d^2 x_m = 0$ .

Binobarin,

$$d^2 f = d(df) = d \left( \frac{\partial f}{\partial x_1} dx_1 + \frac{\partial f}{\partial x_2} dx_2 + \dots + \frac{\partial f}{\partial x_m} dx_m \right) = \\ = dx_1 d \left( \frac{\partial f}{\partial x_1} \right) + dx_2 d \left( \frac{\partial f}{\partial x_2} \right) + \dots + dx_m d \left( \frac{\partial f}{\partial x_m} \right) = \\ = \left( \frac{\partial}{\partial x_1} dx_1 + \frac{\partial}{\partial x_2} dx_2 + \dots + \frac{\partial}{\partial x_m} dx_m \right)^2 f.$$

Demak, ikkinchi tartibli differensiallalar differensial shaklining invariantlig'i xossasiga ega ekan.

Shunga o'xshash, bu holda murakkab funksiyaning ikkidan katta tartibdag'i differensiallarda differensial shaklining invariantlig'i xossasi o'rini bo'lishi ko'rsatiladi.

### 7-§. O'rta qiyomat haqida teorema

$f(x) = f(x_1, x_2, \dots, x_m)$  funksiya  $M \subset R^m$  to'plamda berilgan. Bu to'plamda shunday  $a = (a_1, a_2, \dots, a_m)$  va  $\sigma = (\sigma_1, \sigma_2, \dots, \sigma_m)$  nuqtalarini olaylikki, bu nuqtalarni birlashtiruvchi to'g'ri chiziq kesmasi

$$A = \{ (x_1, x_2, \dots, x_m) \in R^m : x_1 = a_1 + t(\sigma_1 - a_1), x_2 = a_2 + t(\sigma_2 - a_2), \dots, x_m = a_m + t(\sigma_m - a_m); 0 < t \leq 1 \}$$

shu  $M$  to'plamga tegishli bo'lsin:  $A \subset M$ .

**8-teorema.** Agar  $f(x)$  funksiya  $A$  kesmaning  $a$  va  $\sigma$  nuqtalarida uzlusiz bo'lib, kesmaning qolgan barcha nuqtalrida funksiya differensiallanuvchi bo'lsa, u holda  $A$  kesmada shunday  $c$  nuqta ( $c = (c_1, c_2, \dots, c_m)$ ) topiladi,

$$f(c) - f(a) = f'_{x_1}(c)(\sigma_1 - a_1) + f'_{x_2}(c)(\sigma_2 - a_2) + \dots + f'_{x_m}(c)(\sigma_m - a_m)$$

bo'ladi.

◀  $f(x)$  funksiyani  $A$  to'plamda qaraylik. Unda

$$f(x) = f(x_1, x_2, \dots, x_m) = f(a_1 + t(\sigma_1 - a_1), a_2 + t(\sigma_2 - a_2), \dots, a_m + t(\sigma_m - a_m)) \quad (0 < t \leq 1)$$

bo'lib,  $f(x_1, x_2, \dots, x_m)$  i o'zgaruvchining  $[0, 1]$  segmentda berilgan funksiyasiga aylanadi:

$$F(t) = f(a_1 + t(\sigma_1 - a_1), a_2 + t(\sigma_2 - a_2), \dots, a_m + t(\sigma_m - a_m))$$

Bu funksiya  $(0, 1)$  intervalda ushbu

$$F'(t) = f'_{x_1}(a_1 + t(\sigma_1 - a_1)), f'_{x_2}(a_2 + t(\sigma_2 - a_2)), \dots, f'_{x_m}(a_m + t(\sigma_m - a_m))$$

hosilaga ega bo'ladi.

Demak,  $F(t)$  funksiya  $[0, 1]$  segmentda uzlusiz,  $(0, 1)$  intervalda esa  $F'(t)$  hosilaga ega. Unda Lagranj teoremasiga (1-qism, 6-bob, 6-§) ko'ra  $(0, 1)$  intervalda shunday  $t_0$  nuqta topiladiki,

$$F(1) - F(0) = F'(t_0) \quad (0 < t_0 < 1) \quad (13.26)$$

bo'ladi. Ravshanki,

$$\begin{aligned} F(0) &= f(a), & F(1) &= f(\sigma), \\ F'(t_0) &= f'_{x_1}(a_1 + t_0(\sigma_1 - a_1), a_2 + t_0(\sigma_2 - a_2), \dots, a_m + t_0(\sigma_m - a_m))(\sigma_1 - a_1) + \\ &+ f'_{x_2}(a_1 + t_0(\sigma_1 - a_1), a_2 + t_0(\sigma_2 - a_2), \dots, a_m + t_0(\sigma_m - a_m))(\sigma_2 - a_2) + \\ &+ \dots + \\ &+ f'_{x_m}(a_1 + t_0(\sigma_1 - a_1), a_2 + t_0(\sigma_2 - a_2), \dots, a_m + t_0(\sigma_m - a_m))(\sigma_m - a_m) \end{aligned} \quad (13.27)$$

Agar

$$a_1 + t_0(\sigma_1 - a_1) = c_1$$

$$a_2 + t_0(\sigma_2 - a_2) = c_2$$

$$\dots$$

$$a_m + t_0(\sigma_m - a_m) = c_m$$

deb belgilasak, unda  $c = (c_1, c_2, \dots, c_m) \in A$  bo'lib, yuqoridagi (13.26) va (13.27) tengliklardan

$$f(\mathbf{c}) - f(\mathbf{a}) = f'_{x_1}(\mathbf{c})(c_1 - a_1) + f'_{x_2}(\mathbf{c})(c_2 - a_2) + \dots + f'_{x_m}(\mathbf{c})(c_m - a_m)$$

kelib chiqadi. ▶

Bu o'rta qiymat haqidagi teorema deb ataladi.

**2-natija**  $f(\mathbf{x})$  funksiya bog'lamli  $M \subset R^m$  to'plamda berilgan bo'lib, uning har bir nuqtasi differensiallanuvchi bo'lsin. Agar  $M$  to'plamning har bir nuqtasida  $f(\mathbf{x})$  funksiyaning barcha xususiy hosilalari nolga teng bo'lsa, funksiya  $M$  to'plamda o'zgarmas bo'ladi.

◀  $M$  to'plamda  $a = (a_1, a_2, \dots, a_m)$  hamda ixtiyoriy  $x = (x_1, x_2, \dots, x_m)$  nuqtalarni olaylik. Bu nuqtalarni birlashtiruvchi kesma shu  $M$  to'plamga tegishli bo'lsin. U holda shu kesma nuqtalarida 8-teoremaga ko'ra

$$f(\mathbf{a}) = f(\mathbf{x}) + f'_{x_1}(\mathbf{c})(a_1 - x_1) + f'_{x_2}(\mathbf{c})(a_2 - x_2) + \dots + f'_{x_m}(\mathbf{c})(a_m - x_m)$$

bo'ladi. Funksiyaning barcha xususiy hosilalari nolga teng ekanidan

$$f(\mathbf{x}) = f(\mathbf{a})$$

bo'lishi kelib chiqadi.

$a$  va  $x$  nuqtalarni birlashtiruvchi kesma  $M$  to'plamga tegishli bo'lmasa, unda  $M$  to'plamning bog'lamli ekanligidan  $a$  va  $x$  nuqtalarni birlashtiruvchi va to'plamga tegishli bo'lgan siniq chiziq topiladi, bu siniq chiziq kesmalariga yuqoridagi 8-teoremani qo'llay borib,

$$f(\mathbf{x}) = f(\mathbf{a})$$

bo'lishini topamiz. ▶

### 8-§. Ko'p o'zgaruvchili funksiyaning Teylor formulasi

Ma'lumki,  $F(t)$  funksiya  $t = t_0$  nuqtanining atrofida berilgan bo'lib, unda  $F'(t), F''(t), \dots, F^{(n+1)}(t)$  hosilalarga ega bo'lsa, u holda

$$\begin{aligned} F(t) &= F(t_0) + F'(t_0)(t - t_0) + \frac{1}{2!} F''(t_0)(t - t_0)^2 + \dots + \\ &+ \frac{1}{n!} F^{(n)}(t_0)(t - t_0)^n + \frac{F^{(n+1)}(c)}{(n+1)!}(t - t_0)^{n+1}. \end{aligned} \quad (13.28)$$

$$(c = t_0 + \theta(t - t_0), \quad 0 < \theta < 1)$$

bo'ladi (Teylor formulasi).

$f(\mathbf{x}) = f(x_1, x_2, \dots, x_m)$  funksiya ochiq  $M (M \subset R^m)$  to'plamda berilgan. Bu to'plamda  $(x_1^0, x_2^0, \dots, x_m^0)$  nuqtani olib, uning  $U_\delta((x_1^0, x_2^0, \dots, x_m^0)) \subset M$  atrofini qaraylik. Ravshanki,  $\forall (x_1, x_2, \dots, x_m) \in U_\delta((x_1^0, x_2^0, \dots, x_m^0))$  nuqta bilan  $(x_1^0, x_2^0, \dots, x_m^0)$  nuqtani birlashtiruvchi to'g'ri chiziq kesmasi

$$\begin{aligned} A &= \{(\mathbf{x}_1, \mathbf{x}_2, \dots, \mathbf{x}_m) \in R^m : x_1 = x_1^0 + t(x_1' - x_1^0), x_2 = x_2^0 + t(x_2' - x_2^0), \\ &\dots, x_m = x_m^0 + t(x_m' - x_m^0), \quad 0 \leq t \leq 1\} \end{aligned}$$

shu  $U_\delta((x_1^0, x_2^0, \dots, x_m^0))$  atrofga tegishli bo'ladi.

$f(x_1, x_2, \dots, x_m)$  funksiya  $F(t, (x_1^0, x_2^0, \dots, x_m^0))$  da  $n+1$  marta differensiallanuvchi bo'lsin deb uni A to'plamga qaraylik. Unda

$$f(x_1, x_2, \dots, x_m) = f(x_1^0 + t(x'_1 - x_1^0), x_2^0 + t(x'_2 - x_2^0), \dots, x_m^0 + t(x'_m - x_m^0))$$

bo'lib,  $f(x_1, x_2, \dots, x_m)$  funksiya  $F$  o'zgaruvchining  $[0, 1]$  da berilgan funk-siyasiga aylanib qoladi:

$$F(t) = f(x_1^0 + t(x'_1 - x_1^0), x_2^0 + t(x'_2 - x_2^0), \dots, x_m^0 + t(x'_m - x_m^0)) \quad (0 \leq t \leq 1) \quad (13.29)$$

Bu funksiyaning hosilalarini hisoblaylik:

$$F'(t) = \frac{\partial}{\partial x_1} (x_1^0 + t(x'_1 - x_1^0)) + \frac{\partial}{\partial x_2} (x_2^0 + t(x'_2 - x_2^0)) + \dots + \frac{\partial}{\partial x_m} (x_m^0 + t(x'_m - x_m^0)) =$$

$$= \left( \frac{\partial}{\partial x_1} (x'_1 - x_1^0) + \frac{\partial}{\partial x_2} (x'_2 - x_2^0) + \dots + \frac{\partial}{\partial x_m} (x'_m - x_m^0) \right) f,$$

$$\begin{aligned} F''(t) &= \frac{\partial^2 f}{\partial x_1^2} (x'_1 - x_1^0)^2 + \frac{\partial^2 f}{\partial x_2^2} (x'_2 - x_2^0)^2 + \dots + \frac{\partial^2 f}{\partial x_m^2} (x'_m - x_m^0)^2 + \\ &+ 2 \frac{\partial^2 f}{\partial x_1 \partial x_2} (x'_1 - x_1^0)(x'_2 - x_2^0) + \dots + 2 \frac{\partial^2 f}{\partial x_{m-1} \partial x_m} (x'_{m-1} - x_{m-1}^0)(x'_m - x_m^0) = \\ &= \left( \frac{\partial}{\partial x_1} (x'_1 - x_1^0) + \frac{\partial}{\partial x_2} (x'_2 - x_2^0) + \dots + \frac{\partial}{\partial x_m} (x'_m - x_m^0) \right)^2 f. \end{aligned}$$

Umuman  $k$ -tartibli hosila ushbu

$$F^{(k)}(t) = \left( \frac{\partial}{\partial x_1} (x'_1 - x_1^0) + \frac{\partial}{\partial x_2} (x'_2 - x_2^0) + \dots + \frac{\partial}{\partial x_m} (x'_m - x_m^0) \right)^k f \quad (13.30)$$

$$(k = 1, 2, \dots, n+1)$$

ko'rinishida bo'ladi. (Uning to'g'riligi matematik induksiya usuli yordamida isbotlanadi)

Yuqoridagi  $F'(t), F''(t), \dots, F^{(n+1)}(t)$  hosilalarning ifodalariga kirgan  $f(x_1, x_2, \dots, x_m)$  funksiyaning barcha xususiy hosilalari

$$(x_1^0 + t(x'_1 - x_1^0), x_2^0 + t(x'_2 - x_2^0), \dots, x_m^0 + t(x'_m - x_m^0))$$

nuqta hisoblangan.

(13.28) formulada  $t = 0$  va  $t = 1$  deb olinsa, ushbu

$$F(1) = F(0) + \frac{1}{1!} F'(0) + \frac{1}{2!} F''(0) + \dots + \frac{1}{n!} F^{(n)}(0) + \frac{1}{(n+1)!} F^{(n+1)}(\theta) \quad (0 < \theta < 1)$$

hosil bo'ladi.

(13.29) va (13.30) munosabatdan foydalanib quyidagilarni topamiz:

$$F(0) = f(x_1^0, x_2^0, \dots, x_m^0)$$

$$F(1) = f(x'_1, x'_2, \dots, x'_m)$$

$$F^{(k)}(0) = \left( \frac{\partial}{\partial x_1} (x'_1 - x_1^0) + \frac{\partial}{\partial x_2} (x'_2 - x_2^0) + \dots + \frac{\partial}{\partial x_n} (x'_n - x_n^0) \right)^k f$$

$$(k = 1, 2, \dots, n+1)$$

Keyingi tenglikdagi  $f(x_1, x_2, \dots, x_n)$  funksiyaning barcha xususiy hosilalari  $(x_1^0, x_2^0, \dots, x_n^0)$  nuqtada hisoblangan.

Demak, (13.28) formulaga ko'ra

$$\begin{aligned} f(x_1, x_2, \dots, x_n) &= f(x_1^0, x_2^0, \dots, x_n^0) + \left( \frac{\partial}{\partial x_1} (x'_1 - x_1^0) + \right. \\ &\quad \left. + \frac{\partial}{\partial x_2} (x'_2 - x_2^0) + \dots + \frac{\partial}{\partial x_n} (x'_n - x_n^0) \right) f + \\ &+ \frac{1}{2!} \left( \frac{\partial}{\partial x_1} (x'_1 - x_1^0) + \frac{\partial}{\partial x_2} (x'_2 - x_2^0) + \dots + \frac{\partial}{\partial x_n} (x'_n - x_n^0) \right)^2 f + \\ &+ \dots \dots \dots + \\ &+ \frac{1}{n!} \left( \frac{\partial}{\partial x_1} (x'_1 - x_1^0) + \frac{\partial}{\partial x_2} (x'_2 - x_2^0) + \dots + \frac{\partial}{\partial x_n} (x'_n - x_n^0) \right)^n f + \\ &+ \frac{1}{(n+1)!} \left( \frac{\partial}{\partial x_1} (x'_1 - x_1^0) + \frac{\partial}{\partial x_2} (x'_2 - x_2^0) + \dots + \frac{\partial}{\partial x_n} (x'_n - x_n^0) \right)^{n+1} f \end{aligned}$$

bo'ladi, bunda  $f(x_1, x_2, \dots, x_n)$  funksiyaning barcha birinchi, ikkinchi va xokazo  $n$ -tartibli xususiy hosilalari  $(x_1^0, x_2^0, \dots, x_n^0)$  nuqtada, shu funksiyaning barcha  $(n+1)$ -tartibli xususiy hosilalari esa

$$(x_1^0 + \theta(x'_1 - x_1^0), x_2^0 + \theta(x'_2 - x_2^0), \dots, x_n^0 + \theta(x'_n - x_n^0)) \quad (0 < \theta < 1)$$

nuqtada hisoblangan.

Bu formula ko'p o'zgaruvchili  $f(x_1, x_2, \dots, x_n)$  funksiyaning Teylor formulasi deb ataladi.

Xususan, ikki o'zgaruvchili funksiyaning Teylor formulasini quyidagicha bo'ladi:

$$\begin{aligned} f(x_1, x_2) &= f(x_1^0, x_2^0) + \frac{\partial f(x_1^0, x_2^0)}{\partial x_1} (x_1 - x_1^0) + \frac{\partial f(x_1^0, x_2^0)}{\partial x_2} (x_2 - x_2^0) + \\ &+ \frac{1}{2!} \left[ \frac{\partial^2 f(x_1^0, x_2^0)}{\partial x_1^2} (x_1 - x_1^0)^2 + 2 \frac{\partial^2 f(x_1^0, x_2^0)}{\partial x_1 \partial x_2} (x_1 - x_1^0)(x_2 - x_2^0) + \right. \\ &\quad \left. + \frac{\partial^2 f(x_1^0, x_2^0)}{\partial x_2^2} (x_2 - x_2^0)^2 \right] + \dots + \frac{1}{n!} \left[ \frac{\partial^n f(x_1^0, x_2^0)}{\partial x_1^n} (x_1 - x_1^0)^n + \right. \\ &\quad \left. + C_n \frac{\partial^n f(x_1^0, x_2^0)}{\partial x_1^{n-1} \partial x_2} (x_1 - x_1^0)^{n-1}(x_2 - x_2^0) + \dots + \frac{\partial^n f(x_1^0, x_2^0)}{\partial x_2^n} (x_2 - x_2^0)^n \right]. \end{aligned}$$

$$\begin{aligned}
& + \frac{1}{(n+1)!} \left[ \frac{\partial^n f(x_1^0 + \theta(x_1 - x_1^0), x_2^0 + \theta(x_2 - x_2^0))}{\partial x_1^{(n+1)}} (x_1 - x_1^0)^{n+1} + \dots + \right. \\
& \quad \left. + \frac{\partial^n f(x_1^0 + \theta(x_1 - x_1^0), x_2^0 + \theta(x_2 - x_2^0))}{\partial x_2^{(n+1)}} (x_2 - x_2^0)^{n+1} \right]
\end{aligned}$$

### 9-§. Ko'p o'zgaruvchili funksiyaning ekstremum qiyamalari.

*Ekstremumning zaruriy sharti*

*1°. Funksiyaning maksimum va minimum qiyamalari.* Ko'p o'zgaruvchili funksiyaning ekstremum qiyamalari ta'riflari xuddi bir o'zgaruvchili funksiyani singari kiritiladi.

$f(x) = f(x_1, x_2, \dots, x_m)$  funksiya ochiq  $M \subset R^n$  to'plamda berilgan bo'lib,  $x^0 = (x_1^0, x_2^0, \dots, x_m^0) \in M$  bo'lsin.

**7-ta'rif.** Agar  $x^0$  nuqtaning shunday  $U_\delta(x^0) = \{x = (x_1, x_2, \dots, x_m) \in R^n$

$\rho(x, x^0) = \sqrt{(x_1 - x_1^0)^2 + \dots + (x_n - x_n^0)^2} < \delta\}$   $\subset M$  atrofi mavjud bo'lsaki,  $\forall x \in U_\delta(x^0)$  uchun

$$f(x) \leq f(x^0) \quad (f(x) \geq f(x^0))$$

bo'lsa,  $f(x)$  funksiya  $x^0$  nuqtada maksimumga (minimumga) ega deyiladi,  $f(x^0)$  qiymat esa  $f(x)$  funksiyaning maksimum (minimum) qiymati yoki maksimumi (minimumi) deyiladi.

**8-ta'rif.** Agar  $x^0$  nuqtaning shunday  $U_\delta(x^0)$  atrofi mavjud bo'lsaki,  $\forall x \in U_\delta(x^0) \setminus \{x^0\}$  uchun  $f(x) < f(x^0)$  ( $f(x) > f(x^0)$ ) bo'lsa,  $f(x)$  funksiya  $x^0$  nuqtada qat'iy maksimumga (qat'iy minimumga) ega deyiladi.  $f(x^0)$  qiymat esa  $f(x)$  funksiyaning qat'iy maksimum (qat'iy minimum) qiymati yoki qat'iy maksimumi (qat'iy minimumi) deyiladi.

Yuqoridaq ta'riflardagi  $x^0$  nuqta  $f(x)$  funksiyaga maksimum (minimum) (8-ta'rifda), qat'iy maksimum (qat'iy minimum) (9-ta'rifda) qiymat beradigan nuqta deb ataladi.

Funksiyaning maksimum va minimumi umumiyl nom bilan uning ekstremumi deb ataladi.

#### 13.8-misol. Ushbu

$$f(x_1, x_2) = \sqrt{1 - x_1^2 - x_2^2} \quad (x_1^2 + x_2^2 \leq 1)$$

funksiyaning  $(0, 0)$  nuqtada qat'iy maksimumga erishish ko'rsatilsin.

◀ Haqiqatdan ham,  $(0, 0)$  nuqtaning ushbu

$$U_r((0, 0)) = \{(x_1, x_2) \in R^2, x_1^2 + x_2^2 < r^2\}, \quad (0 < r < 1)$$

atrofi olinsa, unda  $\forall (x_1, x_2) \in U_r((0, 0)) \setminus \{(0, 0)\}$  uchun

$$f(x_1, x_2) = \sqrt{1 - x_1^2 - x_2^2} < f(0, 0) = 1$$

bo'ladi. ▶

8 va 9- ta'riflardan ko'rindik,  $f(x)$  funksiyaning  $x^0$  nuqtadagi qiymati  $f(x^0)$  ni uning shu nuqta atrofidagi nuqtalardagi qiymatlari bilangina solishtirilar ekan. Shuning uchun funksiyaning ekstremumi (maksimumi, minimumi) lokal ekstremum (lokal maksimum, lokal minimum) deb ataladi.

**2°. Funksiya ekstremumining zaruriy sharti.**  $f(x_1, x_2, \dots, x_m)$  funksiya ochiq  $M \subset R^m$  to'plamda berilgan. Aytaylik,  $f(x_1, x_2, \dots, x_m)$  funksiya  $x^0 = (x_1^0, x_2^0, \dots, x_m^0)$  nuqtada maksimumga (minimumga) ega bo'lisin. Ta'rifga ko'ra  $x^0 = (x_1^0, x_2^0, \dots, x_m^0)$  nuqtaning shunday  $U_\delta(x_0) \subset M$  atrofi mavjudki,  $\forall x \in U_\delta(x^0)$  uchun

$$\begin{aligned} f(x_1, x_2, \dots, x_m) &\leq f(x_1^0, x_2^0, \dots, x_m^0) \\ (f(x_1, x_2, \dots, x_m)) &\geq f(x_1^0, x_2^0, \dots, x_m^0) \end{aligned}$$

xususani

$$\begin{aligned} f(x_1, x_2^0, x_3^0, \dots, x_m^0) &\leq f(x_1^0, x_2^0, \dots, x_m^0) \\ (f(x_1, x_2^0, \dots, x_m^0)) &\geq f(x_1^0, x_2^0, \dots, x_m^0) \end{aligned}$$

bo'ladi. Natijada bir o'zgaruvchiga  $x_1$  ga bog'liq bo'lган  $f(x_1, x_2^0, \dots, x_m^0)$  funksiyaning  $U_\delta(x^0)$  da eng katta (eng kichik) qiymati  $f(x_1^0, x_2^0, \dots, x_m^0)$  ga erishishini ko'ramiz. Agarda  $x^0$  nuqtada  $f'_{x_1}(x_0)$  xususiy hosila mavjud bo'lsa, unda Ferma teoremasi (qaralsin, 1-qism, 6-bob, 6-§)ga ko'ra

$$f'_{x_1}(x_1^0, x_2^0, \dots, x_m^0) = f'_{x_1}(x^0) = 0$$

bo'ladi.

Xuddi shuningdek,  $f'_{x_1}(x^0), \dots, f'_{x_m}(x^0)$  xususiy hosilalar mavjud bo'lsa,

$$f'_{x_1}(x^0) = 0, f'_{x_2}(x^0) = 0, \dots, f'_{x_m}(x^0) = 0$$

bo'lishini topamiz.

Shunday qilib quyidagi teoremagaga kelamiz.

**9-teorema.** Agar  $f(x)$  funksiya  $x^0$  nuqtada ekstremumga erishsa va shu nuqtada barcha  $f'_{x_1}, f'_{x_2}, \dots, f'_{x_m}$  xususiy hosilalarga ega bo'lsa, u holda

$$f'_{x_1}(x^0) = 0, f'_{x_2}(x^0) = 0, \dots, f'_{x_m}(x^0) = 0$$

bo'ladi.

Biroq  $f(x)$  funksiyaning biror  $x' \in R^m$  nuqtada barcha xususiy hosilalarga ega va

$$f'_{x_1}(x') = 0, f'_{x_2}(x') = 0, \dots, f'_{x_m}(x') = 0$$

bo'lishidan uning shu  $x'$  nuqtada ekstremumga ega bo'lishi har doim ham kelib chiqavermaydi.

Masalan,  $R^2$  to'plamda berilgan

$$f(x_1, x_2) = x_1 x_2$$

funksiyani qaraylik. Bu funksiya  $f'_{x_1}(x_1, x_2) = x_2$ ,  $f'_{x_2}(x_1, x_2) = x_1$  xususiy hosilalarga ega bo'lub, ular  $(0,0)$  nuqtada ekstremumga ega emas (bu funksiyaning grafigi giperbolik paraboloidni ifodalaydi, qaralsin 12-bob, 3-§).

Demak, 9-teorema bir argumentli funksiyalardagidek funksiya ekstremumga erishishining zaruriy shartini ifodalar ekan.

$f(x)$  funksiya xususiy hosilalarini nolga aylantiradigan nuqtalar uning statcionar nuqtalari deyiladi.

### 10-§. Funksiya ekstremumining yetarli sharti

Biz yuqorida  $f(x)$  funksiyaning  $x^0$  nuqtada ekstremumga erishishining zaruriy shartini ko'sratdik. Endi funksiyaning ekstremumga erishishining yetarli shartini o'rganamiz.

$f(x)$  funksiya  $x^0 \in R^m$  nuqtaning biror

$$U_\delta(x^0) = \{x \in R^m \mid \rho(x, x^0) < \delta\} \quad (\delta > 0)$$

atrosida berilgan bo'lsin. Ushbu

$$\Delta = f(x) - f(x^0) \quad (13.31)$$

ayirmani qaraylik. Ravshanki, bu ayirma  $U_\delta(x^0)$  da o'z ishorasini saqlasa, ya'ni har doim  $\Delta \geq 0$  ( $\Delta \leq 0$ ) bo'lsa,  $f(x)$  funksiya  $x^0$  nuqtada minimumga (maksimumga) erishadi. Agar (13.31) ayirma har qanday  $U_\delta(x^0)$  atrosda ham o'z ishorasini saqlamasa, u holda  $f(x)$  funksiya  $x^0$  nuqtada ekstremumga ega bo'lmaydi. Demak, masala (13.31) ayirma o'z ishorasini saqlaydigan  $U_\delta(x^0)$  atrof mavjudmi yoki yo'qmi, shuni aniqlashdan ibrat. Bu masalani biz. xususiy holda ya'ni  $f(x)$  funksiya ma'lum shartlarni bajargan holda echamiz.

$f(x)$  funksiya quyidagi shartlarni bajarsin:

1)  $f(x)$  funksiya biror  $U_\delta(x^0)$  da uzlusiz, barcha o'zgaruvchilari bo'yicha birinchisi va ikkinchi tartibli uzlusiz xususiy hosilalarga ega;

2)  $x^0$  nuqta  $f(x)$  funksiyaning statcionar nuqtasi, ya'ni

$$f'_{x_1}(x^0) = 0, f'_{x_2}(x^0) = 0, \dots, f'_{x_m}(x^0) = 0.$$

Ushbu bobning 8-§ ida keltirilgan Teylor formulasidan foydalananib,  $x^0$  nuqtaning statcionar nuqta ekanligini e'tiborga olib, quyidagini topamiz:

$$\begin{aligned} f(x) &= f(x^0) + \frac{1}{2} [f''_{x_1 x_1} \Delta x_1^2 + f''_{x_1 x_2} \Delta x_1 \Delta x_2 + \dots + f''_{x_m x_m} \Delta x_m^2 + \\ &+ 2(f''_{x_1 x_2} \Delta x_1 \Delta x_2 + f''_{x_1 x_3} \Delta x_1 \Delta x_3 + \dots + f''_{x_{m-1} x_m} \Delta x_{m-1} \Delta x_m)] = \\ &= f(x^0) + \frac{1}{2} \sum_{k=1}^m f''_{x_k x_k} \Delta x_k \Delta x_k. \end{aligned}$$

Bu munosabada  $f(x)$  funksiyaning barcha xususiy hosilalari  $f''_{x_i x_j}$  ( $i, k = 1, 2, \dots, m$ ) lar ushbu

$$(x_1^0 + \theta \Delta x_1, x_2^0 + \theta \Delta x_2, \dots, x_m^0 + \theta \Delta x_m) \quad (0 < \theta < 1)$$

nuqtadan hisoblangan va

$$\Delta x_1 = x_1 - x_1^0, \Delta x_2 = x_2 - x_2^0, \dots, \Delta x_m = x_m - x_m^0.$$

Demak,

$$\Delta = \frac{1}{2} \sum_{i,k=1}^m f_{x_i x_k}''(x^0) \Delta x_i \Delta x_k$$

Berilgan  $f(x)$  funksiya ikkinchi tartibli hosilalarining statsionar nuqtadagi qiymatlarini quyidagicha belgilaylik:

$$a_{ik} = f_{x_i x_k}''(x^0) \quad (i, k = 1, 2, \dots, m)$$

Unda  $f_{x_i x_k}''(x)$  ning  $x^0$  nuqtada uzlucksizligidan

$$f_{x_i x_k}''(x) = f_{x_i x_k}''(x_1^0 + \theta_1 x_1, x_2^0 + \theta_2 x_2, \dots, x_m^0 + \theta_m x_m) = a_{ik} + \alpha_{ik}$$

$(i, k = 1, 2, 3, \dots, m)$  bo'lishi kelib chiqadi. Bu munosabatda  $\Delta x_1 \rightarrow 0, \Delta x_2 \rightarrow 0, \dots, \Delta x_m \rightarrow 0$  da barcha  $\alpha_{ik} \rightarrow 0$  va 6-§ da keltirilgan 6-teoremagaga asosan

$$\alpha_{ik} = a_{ik} \quad (i, k = 1, 2, 3, \dots, m)$$

bo'ladi. Natijada (13.31) ayirma ushbu

$$\Delta = \frac{1}{2} \left[ \sum_{i,k=1}^m a_{ik} \Delta x_i \Delta x_k + \sum_{i,k=1}^m a_{ik} \Delta x_i \Delta x_k \right]$$

ko'rinishni oladi. Buni quyidagicha ham yozish mumkin:

$$\Delta = \frac{\rho^2}{2} \left[ \sum_{i,k=1}^m a_{ik} \frac{\Delta x_i}{\rho} \cdot \frac{\Delta x_k}{\rho} + \sum_{i,k=1}^m a_{ik} \frac{\Delta x_i}{\rho} \cdot \frac{\Delta x_k}{\rho} \right].$$

Agar

$$\xi_i = \frac{\Delta x_i}{\rho} \quad (i = 1, 2, \dots, m)$$

deb belgilasak, unda

$$\Delta = \frac{\rho^2}{2} \left[ \sum_{i,k=1}^m a_{ik} \xi_i \cdot \xi_k + \sum_{i,k=1}^m a_{ik} \xi_i \cdot \xi_k \right] \quad (13.32)$$

bo'ladi.

Ushbu

$$P(\xi_1, \xi_2, \dots, \xi_m) = \sum_{i,k=1}^m a_{ik} \xi_i \cdot \xi_k$$

ifoda  $\xi_1, \xi_2, \dots, \xi_m$  o'zgaruvchilarning kvadratik formasi deb ataladi.  $a_{ik}$  ( $i, k = 1, 2, 3, \dots, m$ ) lar esa kvadratik formaning koeffitsientlari deyiladi. Ravshanki, har qanday kvadratik forma o'z koeffitsientlari orqali to'la aniqlanadi. Kvadratik formalar algebra kursida batafsil o'rganiladi. Quyida biz kvadratik formaga doir ba'zi (kelgusida qo'llaniladigan) tushunchalarni eslatib o'tamiz.

Ravshanki,  $\xi_1 = \xi_2 = \dots = \xi_m = 0$  bo'lsa, har qanday kvadratik forma uchun

$$P(0, 0, \dots, 0) = 0$$

bo'ladi.

Endi boshqa nuqtalarni qaraylik. Quyidagi hollar bo'lishi mumkin:

1<sup>o</sup>. Barcha  $\xi_1^2 + \xi_2^2 + \dots + \xi_m^2 > 0$  nuqtalar uchun

$$P(\xi_1, \xi_2, \dots, \xi_m) > 0.$$

Bu holda kvadratik forma musbat aniqlangan deyiladi.

2<sup>o</sup>. Barcha  $\xi_1^2 + \xi_2^2 + \dots + \xi_m^2 > 0$  nuqtalar uchun

$$P(\xi_1, \xi_2, \dots, \xi_m) < 0.$$

Bu holda kvadratik forma manfiy aniqlangan deyiladi.

3<sup>o</sup>. Ba'zan  $(\xi_1, \xi_2, \dots, \xi_m)$  nuqtalar uchun  $P(\xi_1, \xi_2, \dots, \xi_m) > 0$  ba'zi nuqtalar uchun

$$P(\xi_1, \xi_2, \dots, \xi_m) < 0$$

Bu holda kvadratik forma noaniq deyiladi.

4<sup>o</sup>. Barcha  $\xi_1^2 + \xi_2^2 + \dots + \xi_m^2 > 0$  nuqtalar uchun

$$P(\xi_1, \xi_2, \dots, \xi_m) \geq 0$$

va ular orasida shunday  $(\xi_1, \xi_2, \dots, \xi_m)$  nuqtalar ham borki,

$$P(\xi_1, \xi_2, \dots, \xi_m) = 0.$$

Bu holda kvadratik forma yarimmusbat aniqlangan deyiladi.

5<sup>o</sup>. Barcha  $\xi_1^2 + \xi_2^2 + \dots + \xi_m^2 > 0$  nuqtalar uchun

$$P(\xi_1, \xi_2, \dots, \xi_m) \leq 0$$

va ular orasida shunday  $(\xi_1, \xi_2, \dots, \xi_m)$  nuqtalar ham borki,

$$P(\xi_1, \xi_2, \dots, \xi_m) = 0.$$

Bu holda kvadratik forma yarimmanfiy aniqlangan deyiladi.

Keltirilgan hollarni alohida-alohida tahlil qilamiz:

1<sup>o</sup>. Ushbu

$$Q(\xi_1, \xi_2, \dots, \xi_m) = \sum_{i,k=1}^m a_{ik} \xi_i \cdot \xi_k$$

kvadratik forma musbat aniqlangan bo'lisin. Avvalo yuqoridagi

$$\rho = \sqrt{\Delta x_1^2 + \Delta x_2^2 + \dots + \Delta x_m^2}$$

va

$$\xi_i = \frac{\Delta x_i}{\rho} \quad (i = 1, 2, \dots, m)$$

tengliklardan

$$\xi_1^2 + \xi_2^2 + \dots + \xi_m^2 = 1$$

ekanligini topamiz. Ma'lumki,  $R^m$  fazoda

$$S_1(0) = S_1((0, 0, \dots, 0)) = \{(\xi_1, \xi_2, \dots, \xi_m) \in R^m : \xi_1^2 + \xi_2^2 + \dots + \xi_m^2 = 1\}$$

markazi  $0 = (0, 0, \dots, 0)$  nuqtada radiusi 1 ga teng sferani ifodalaydi. Sfera yopiq va chegaralangan to'plam. Veyershtassning birinchi teoremasiga asosan shu sferada  $Q(\xi_1, \xi_2, \dots, \xi_m)$  funksiya uzlusiz funksiya sifatida chegaralangan, xususan quyidan chegaralangan bo'ladi:

$$Q(\xi_1, \xi_2, \dots, \xi_m) \geq C \quad (C - const)$$

Agar  $Q(\xi_1, \xi_2, \dots, \xi_m)$  kvadratik formaning musbat aniqlangan ekanligini e'tiborga olsak, unda  $C \geq 0$  bo'llishini topamiz.

Ikkinci tomondan, Veyerstrassning ikkinchi teoremasiga ko'ra bu  $Q(\xi_1, \xi_2, \dots, \xi_m)$  funksiya  $S_1(0)$  sferada o'zining aniq quyi chegarasiga erishadi, ya'ni biror  $(\xi_1^0, \xi_2^0, \dots, \xi_m^0) \in S_1(0)$  uchun

$$Q(\xi_1^0, \xi_2^0, \dots, \xi_m^0) = \min Q(\xi_1, \xi_2, \dots, \xi_m)$$

bo'ladi. Yana  $Q(\xi_1, \xi_2, \dots, \xi_m)$  kvadratik formaning musbat aniqlangan ekanligini e'tiborga olsak,

$$Q(\xi_1^0, \xi_2^0, \dots, \xi_m^0) > 0$$

ekanini topamiz. Demak,  $S_1(0)$  sferada

$$Q(\xi_1, \xi_2, \dots, \xi_m) = \sum_{i,k=1}^m a_{ik} \xi_i \cdot \xi_k \geq C > 0$$

bo'ladi.

Endi

$$\sum_{i,k=1}^m a_{ik} \xi_i \cdot \xi_k$$

ni baholaymiz. Koshi-Bunyakovskiy tengsizligidan foydalanib, topamiz:

$$\begin{aligned} \left| \sum_{i,k=1}^m a_{ik} \xi_i \cdot \xi_k \right| &= \left| \sum_{i=1}^m \left( \sum_{k=1}^m a_{ik} \xi_k \right) \cdot \xi_i \right| \leq \left[ \sum_{i=1}^m \left( \sum_{k=1}^m a_{ik} \xi_k \right)^2 \right]^{\frac{1}{2}} \cdot \left( \sum_{i=1}^m \xi_i^2 \right)^{\frac{1}{2}} \\ &= \left[ \sum_{i=1}^m \left( \sum_{k=1}^m a_{ik} \xi_k \right)^2 \right]^{\frac{1}{2}} \leq \left[ \sum_{i=1}^m \left( \sum_{k=1}^m a_{ik}^2 \sum_{i=1}^m \xi_i^2 \right) \right]^{\frac{1}{2}} = \left( \sum_{i,k=1}^m a_{ik}^2 \right)^{\frac{1}{2}}. \end{aligned}$$

Ma'lumki,  $\Delta x_1 \rightarrow 0, \Delta x_2 \rightarrow 0, \dots, \Delta x_m \rightarrow 0$  da barcha  $a_{ik} \rightarrow 0$ . Bundan foydalanib  $x^0$  nuqtaning atrofini yetarlicha kichik qilib olish hisobiga

$$\left( \sum_{i,k=1}^m a_{ik}^2 \right)^{\frac{1}{2}} < \frac{\epsilon}{2}$$

tengsizlikka erishish mumkin. Demak, (13.32) dan

$$\Delta = \frac{\rho^2}{2} \left( \sum_{i,k=1}^m a_{ik} \xi_i \cdot \xi_k + \sum_{i,k=1}^m a_{ik} \xi_i \cdot \xi_k \right) \geq \frac{\rho^2}{2} \left( c - \frac{\epsilon}{2} \right) = \frac{\rho^2 c}{4} > 0$$

2<sup>o</sup>. Quyidagi

$$Q(\xi_1, \xi_2, \dots, \xi_m) = \sum_{i,k=1}^m a_{ik} \xi_i \cdot \xi_k$$

kvadratik forma manfiy aniqlangan bo'lsin. Bu holda  $x^0$  nuqtaning yetarlicha kichik atrofida  $\Delta = \frac{\rho^2}{2} \left( \sum_{i,k=1}^m a_{ik} \xi_i \cdot \xi_k + \sum_{i,k=1}^m a_{ik} \xi_i \cdot \xi_k \right) < 0$  bo'lishi 1-holdagiga o'xshash ko'rsatiladi. Natijada quyidagi teoremaga kelamiz.

**10-teorema.**  $f(x)$  funksiya  $x^0$  nuqtaning biror  $U_\delta(x^0)$  atrofida ( $\delta > 0$ ) berilgan bo'lsin va u ushbu shartlarni bajarsin:

1)  $f(x)$  funksiya  $U_\delta(x^0)$  da barcha o'zgaruvchilar  $x_1, x_2, \dots, x_m$  bo'yicha birinchi va ikkinchi tartibli uzlusiz xususiy hosilalarga ega;

2)  $x^0$  nuqta  $f(x)$  funksiyaning statcionar nuqtasi;

3) koefitsientlari

$$a_{ik} = f''_{x_i x_k}(x^0) \quad (i, k = 1, 2, \dots, m)$$

bo'lgan

$$Q(\xi_1, \xi_2, \dots, \xi_m) = \sum_{i,k=1}^m a_{ik} \xi_i \cdot \xi_k$$

kvadratik forma musbat (mansiy) aniqlangan. U holda  $f(x)$  funksiya  $x^0$  nuqtada maksimumga (minimumga) erishadi.

Bu teorema funksiya ekstremumining yetarli shartini ifodalaydi.

**3'. Agar**

$$Q(\xi_1, \xi_2, \dots, \xi_m) = \sum_{i,k=1}^m a_{ik} \xi_i \cdot \xi_k$$

kvadratik forma noaniq bo'lsa,  $f(x)$  funksiya  $x^0$  nuqtada ekstremumga erishmaydi. Shuni isbotlaylik  $\xi_1, \xi_2, \dots, \xi_m$  larning shunday  $(h_1, h_2, \dots, h_m)$  va  $(\bar{h}_1, \bar{h}_2, \dots, \bar{h}_m)$  qiymatlari topiladiki,

$$Q(h_1, h_2, \dots, h_m) > 0, \quad Q(\bar{h}_1, \bar{h}_2, \dots, \bar{h}_m) < 0 \quad (13.33)$$

bo'ladi.

$$x^0 = (x_1^0, x_2^0, \dots, x_m^0), \quad (x_1^0 + h_1, x_2^0 + h_2, \dots, x_m^0 + h_m)$$

nuqtalarni birlashtiruvchi

$$x_1 = x_1^0 + th_1,$$

$$x_2 = x_2^0 + th_2$$

$$\dots$$

$$(0 < t < 1) \quad (13.34)$$

$$x_m = x_m^0 + t h_m$$

kesmaning nuqtalari uchun yuqoridaagi (13.32) munosabat ushbu

$$\Delta = \frac{t^2}{2} \left( \sum_{i,k=1}^m a_{ik} h_i \cdot h_k + \sum_{i,k=1}^m a_{ik} \bar{h}_i \cdot \bar{h}_k \right)$$

ko'rinishiga keladi. Bu tenglikning o'ng tomonidagi birinchi qo'shiluvchi (13.33) ga ko'ra musbat bo'ladi. Ikkinchi qo'shiluvchi esa,  $t \rightarrow 0$  da nolga intiladi (chunki  $t \rightarrow 0$  da  $\Delta x_1 = x_1 - x_1^0 \rightarrow 0$ ,  $\Delta x_2 = x_2 - x_2^0 \rightarrow 0, \dots, \Delta x_m = x_m - x_m^0 \rightarrow 0$ ). Demak, (13.34) kesmaning  $x^0$  nuqtaga yetarlicha yaqin bo'lgan  $x$  nuqtalari uchun  $\Delta$  ayirma musbat, ya'ni

$$f(x) > f(x^0)$$

bo'ladi.

Xuddi shunga o'xshash,

$$x_1 = x_1^0 + t h_1,$$

$$x_2 = x_2^0 + t h_2$$

.....,

$$x_m = x_m^0 + t h_m$$

kesmaning  $x^0$  nuqtaga yetarlicha yaqin bo'lgan  $x$  nuqtalari uchun  $\Delta$  ayirma manfiy, ya'ni

$$f(x) < f(x^0)$$

bo'lishi ko'satiladi.

Demak,  $\Delta = f(x) - f(x^0)$  ayirma  $x^0$  nuqtaning har qanday yetarlicha kichik atrofida o'z ishorasini saqlamaydi. Bu esa  $f(x)$  funksiyaning  $x^0$  nuqtada ekstremumga erishmasligini bildiradi.

**4<sup>o</sup> – 5<sup>o</sup>.** Agar

$$Q(\xi_1, \xi_2, \dots, \xi_m) = \sum_{i,k=1}^m a_{ik} \xi_i \cdot \xi_k$$

kvadratik forma yarimmusbat aniqlangan bo'lsa yoki yarimmanfiy aniqlangan bo'lsa,  $f(x)$  funksiya  $x^0$  nuqtada ekstremumga erishishi ham erishmasligi ham mumkin. Bu «shubhali» hol qo'shimcha tekshirib aniqlanadi.

Yuqoridagi 10-teoremaning 3-sharti, ya'ni  $Q(\xi_1, \xi_2, \dots, \xi_m)$  kvadratik formaning musbat yoki manfiy aniqlanganlikka aloqador sharti teoremaning markaziy qismini tashkil etadi. Kvadratik formaning musbat yoki manfiy aniqlanganligini algebra kursidan ma'lum bo'lgan Silvestr alomatidan foydalanib topish mumkin. Quyidagi bu alomatni isbotsiz keltiramiz.

*Silvestr alomati.* Ushbu

$$P(\xi_1, \xi_2, \dots, \xi_m) = \sum_{i,k=1}^m a_{ik} \xi_i \cdot \xi_k$$

kvadratik formaning musbat aniqlangan bo'lishi uchun

$$a_{11} > 0, \begin{vmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{vmatrix} > 0, \dots, \begin{vmatrix} a_{11} & a_{12} & \dots & a_{1m} \\ a_{21} & a_{22} & \dots & a_{2m} \\ \dots & \dots & \dots & \dots \\ a_{m1} & a_{m2} & \dots & a_{mm} \end{vmatrix} > 0$$

tengsizliklarning, manfiy aniqlangan bo'lishi uchun

$$a_{11} < 0, \begin{vmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{vmatrix} > 0, \dots, (-1)^m \begin{vmatrix} a_{11} & a_{12} & \dots & a_{1m} \\ a_{21} & a_{22} & \dots & a_{2m} \\ \dots & \dots & \dots & \dots \\ a_{m1} & a_{m2} & \dots & a_{mm} \end{vmatrix} > 0$$

tengsizliklarning bajarilishi zarur va yetarli.

Xususiy holni. funksiya ikki o'zgaruvchiga bog'liq bo'lgan holni qaraylik.  
 $f(x_1, x_2)$  funksiya  $x^0 = (x_1^0, x_2^0)$  nuqtaning biror atrofi

$$U_\delta(x^0) = \{x = (x_1, x_2) \in R^2 : \rho(x, x^0) < \delta\} \quad (\delta > 0)$$

da birinchi, ikkinchi tartibli uzlusiz hosilalarga ega bo'lib,  $x^0$  esa qaratayotgan funksiyaning statsionar nuqtasi bo'lsin:

$$f'_{x_1}(x^0) = 0, \quad f''_{x_1}(x^0) = 0.$$

Odatdagidek

$$a_{11} = f''_{x_1^2}(x^0), \quad a_{12} = f''_{x_1 x_2}(x^0), \quad a_{22} = f''_{x_2^2}(x^0).$$

1). Agar

$$\begin{vmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{vmatrix} = a_{11}a_{22} - a_{12}^2 > 0 \text{ va } a_{11} > 0$$

bo'lsa,  $f(x)$  funksiya  $x^0$  nuqtada minimumga erishadi,

2). Agar

$$a_{11}a_{22} - a_{12}^2 > 0 \text{ va } a_{11} < 0$$

bo'lsa,  $f(x)$  funksiya  $x^0$  nuqtada maksimumga erishadi.

3). Agar

$$a_{11}a_{22} - a_{12}^2 < 0$$

bo'lsa,  $f(x)$  funksiya  $x^0$  nuqtada ekstremumga erishmaydi.

4). Agar

$$a_{11}a_{22} - a_{12}^2 = 0$$

bo'lsa,  $f(x)$  funksiya  $x^0$  nuqtada ekstremumga erishishi mumkin, erishmasligi ham mumkin. Bu «shuhbali» hol qo'shimcha tekshirish yordamida aniqlanadi.

Haqiqatdan ham 1)- va 2)- hollarda kvadratik forma mos ravishda musbat aniqlangan yoki manfiy aniqlangan bo'ladi (qaralsin: Silvestr alomati).

3)- holda, ya'n'i

$$a_{11}a_{22} - a_{12}^2 < 0 \quad (13.35)$$

bo'lganda  $Q(\xi_1, \xi_2) = a_{11}\xi_1^2 + 2a_{12}\xi_1\xi_2 + a_{22}\xi_2^2$  kvadratik forma noaniq bo'ladi. Shuni isbotlaylik.

$a_{11} = 0$  bo'lsin. Bu holda (13.35) dan  $a_{12} \neq 0$  bo'lishi kelib chiqadi. Natijada  $Q(\xi_1, \xi_2)$  kvadratik forma ushbu

$$Q(\xi_1, \xi_2) = (2a_{12}\xi_1 + a_{22}\xi_2)\xi_2,$$

ko'rinishga keladi. Bu kvadratik forma

$$\xi_1 = \frac{1 - a_{22}}{2a_{12}}, \quad \xi_2 = 1$$

qiymatda musbat:

$$Q\left(\frac{1 - a_{22}}{2a_{12}}, 1\right) = 1 > 0 \text{ va } \xi_1 = \frac{1 + a_{22}}{2a_{12}}, \quad \xi_2 = -1$$

qiymatda esa manfiy:

$$Q\left(\frac{1+a_{22}}{2a_{11}}, -1\right) = -1 < 0$$

bo'ladi.

Endi  $a_{11} > 0$  bo'lsin. Bu holda  $Q(\xi_1, \xi_2)$  kvadratik formani quyidagicha yozib olamiz:

$$Q(\xi_1, \xi_2) = a_{11} \left[ \left( \xi_1 + \frac{a_{12}}{a_{11}} \xi_2 \right)^2 + \frac{a_{11}a_{22} - a_{12}^2}{a_{11}^2} \xi_2^2 \right] \quad (13.36)$$

Keyingi tenglikdan  $\xi_1 = -\frac{a_{12}}{a_{11}}$ ,  $\xi_2 = -1$  qiymatda

$$Q\left(-\frac{a_{12}}{a_{11}}, 1\right) < 0$$

va  $\forall \xi_1 > -\frac{a_{12}}{a_{11}} + \sqrt{\frac{a_{12}^2 - a_{11}a_{22}}{a_{11}^2}}$ ,  $\xi_2 = 1$  qiymatlarda esa  
 $Q(\xi_1, 1) > 0$

bo'lishini topamiz.

Va nihoyat,  $a_{11} < 0$  bo'lsin. Bu holda (13.36) munosabatdan foydalanim,

$Q(\xi_1, \xi_2)$  kvadratik formaning  $\xi_1 = -\frac{a_{12}}{a_{11}}$ ,  $\xi_2 = 1$  qiymatda musbat  
 $Q\left(-\frac{a_{12}}{a_{11}}, 1\right) > 0$  va  $\forall \xi_1 > -\frac{a_{12}}{a_{11}} + \sqrt{\frac{a_{12}^2 - a_{11}a_{22}}{a_{11}^2}}$ ,  $\xi_2 = 1$  qiymatda esa manfiy  
 $Q(\xi_1, 1) < 0$

bo'lishini topamiz.

Shunday qilib,  $a_{11}a_{22} - a_{12}^2 < 0$  bo'lganda  $Q(\xi_1, \xi_2)$  kvadratik formaning noaniq bo'lishi isbot etildi.

4)- holni, ya'ni  $a_{11}a_{22} - a_{12}^2 = 0$  bo'lgan holni qaraylik. Bu holda,  $a_{11} = 0$  bo'lsa, unda  $a_{12} = 0$  bo'lib,  $Q(\xi_1, \xi_2)$  kvadratik forma ushbu

$$Q(\xi_1, \xi_2) = a_{22}\xi_2^2$$

ko'rinishni oladi.

Ravshanki,  $a_{22} \geq 0$  bo'lganda

$$Q(\xi_1, \xi_2) \geq 0,$$

$a_{22} < 0$  bo'lganda

$$Q(\xi_1, \xi_2) \leq 0$$

bo'lib,  $\xi_1$  ning ixtiyoriy qiymatida

$$Q(\xi_1, 0) = 0$$

bo'ladi.

Agar  $a_{11} > 0$  bo'lsa,

$$Q(\xi_1, \xi_2) = a_{11} \left( \xi_1 + \frac{a_{12}}{a_{11}} \xi_2 \right)^2 \leq 0,$$

$a_{11} < 0$  bo'lganda

$$Q(\xi_1, \xi_2) = a_{11} \left( \xi_1 + \frac{a_{12}}{a_{11}} \xi_2 \right)^2 \leq 0,$$

bo'lib,  $\xi_1$  va  $\xi_2$  larning

$$\xi_1 = -\frac{a_{12}}{a_{11}} \xi_2$$

tenglikni qanoatlantiruvchi barcha qiymatlarida  $Q(\xi_1, \xi_2)$  kvadratik forma nolga teng bo'ladi. Demak, qaralayotgan holda  $Q(\xi_1, \xi_2)$  kvadratik forma yarimmusbat aniqlangan yoki yarimmansiy aniqlangan bo'ladi.

### 13.9-misol. Ushbu

$$f(x_1, x_2) = x_1^3 + x_2^3 - 3ax_1x_2 \quad (a \neq 0)$$

funksiya ekstremumga tekshiriladi.

◀ Bu funksianing birinchi va ikkinchi tartibli hosilalari

$$f'_{x_1}(x_1, x_2) = 3x_1^2 - 3ax_2, \quad f'_{x_2}(x_1, x_2) = 3x_2^2 - 3ax_1$$

$$f''_{x_1}(x_1, x_2) = 6x_1, \quad f''_{x_1 x_2}(x_1, x_2) = -3a, \quad f''_{x_2}(x_1, x_2) = 6x_2$$

bo'ladi. Ushbu

$$\begin{cases} 3x_1^2 - 3ax_2 = 0 \\ 3x_2^2 - 3ax_1 = 0 \end{cases}$$

sistemanini ehib, berilgan funksianing statsionar nuqtalari  $(0, 0)$  va  $(a, a)$  ekanini topamiz.

$(a, a)$  nuqtada

$$a_{11} = 6a, \quad a_{12} = -3a, \quad a_{22} = 6a$$

bo'lib,

$$a_{11}a_{22} - a_{12}^2 = 27a^2 > 0$$

bo'ladi.

Demak,  $a > 0$  bo'lganda ( $a_{11} > 0$  bo'lib) funksiya  $(a, a)$  nuqta minimumga erishadi,  $a < 0$  bo'lganda funksiya  $(a, a)$  nuqtada maksimumga erishadi.

Ravshanki,

$$f(a, a) = -a^3.$$

$(0, 0)$  nuqtada

$$a_{11}a_{22} - a_{12}^2 = -9a^2 < 0$$

bo'ladi. Demak, berilgan funksiya  $(0, 0)$  nuqtada ekstremumga erishmaydi. ▶

### 11-§. Oshkormas funksiyalar

**1°. Oshkormas funksiya tushunchasi.** Ma'lumki,  $X \subset R$  to'plamdag'i har bir  $x$  songa biron qoidaga ko'ra  $Y \subset R$  to'plamdan hitta  $y$  son mos qo'yilgan bo'lsa,  $X$  to'plamda funksiya berilgan deb atalar va u

$$f : x \rightarrow y \text{ yoki } y = f(x)$$

kabi belgilanar edi.

Ikki  $x$  va  $y$  argumentlarning  $F(x, y)$  funksiyasi

$$M = \{(x, y) \in R^2 : a < x < b, c < y < d\}$$

to'plamda berilgan bo'lsin. Ushbu

$$F(x, y) = 0$$

(13.37)

tenglamani qaraylik. Biron  $x_0$  sonni ( $x_0 \in (a, b)$ ) olib, uni yuqoridagi tenglamadagi  $x$  ning o'rniiga qo'yamiz. Natijada  $y$  ni topish uchun quyidagi

$$F(x_0, y) = 0$$

tenglamaga kelamiz. Bu tenglamaning echimi haqida ushbu hollar bo'lishi mumkin:

1). (13.37) tenglama yagona haqiqiy  $y_0$  echimga ega.

2). (13.37) tenglama bitta ham haqiqiy echimga ega emas,

3). (13.37) tenglama bir nechta, hallo chekst: ko'p haqiqiy echimga ega.

Masalan,

$$F(x, y) = \begin{cases} y - x^2, & \text{agar } x \geq 0 \text{ bo'lsa,} \\ y^2 + x, & \text{agar } x < 0 \text{ bo'lsa} \end{cases}$$

u holda

$$F(x, y) = 0$$

tenglama  $x_0 \geq 0$  bo'lganda, yagona  $y = x_0^2$  echimga,  $x_0 < 0$  bo'lganda ikkita

$$y = \sqrt{-x_0}, \quad y = -\sqrt{-x_0}$$

echimga ega bo'ladi.

Agar biron  $F(x, y) = 0$  tenglama uchun 1)- hol o'rini bo'lsa bunday tenglama e'tiborga loyiq. Uning yordamida funksiya aniqlanishi mumkin.

Endi  $x$  o'zgaruvchining qiymatlaridan iborat shunday  $X$  to'plamni qaraylikki, hu to'plamdan olingan har bir qiymatda  $F(x, y) = 0$  tenglama yagona echimga ega bo'lsin.

$X$  to'plamdan ixtiyoriy  $x$  sonni olib, bu songa  $F(x, y) = 0$  tenglamaning yagona echimi bo'lgan  $y$  sonni mos qo'yamiz. Natijada  $X$  to'plamdan olingan har bir  $x$  ga yuqoridagi ko'rsatilgan qoidaga ko'ra bitta  $y$  mos qo'yilib. funksiya hosil bo'ladi. Bunda  $x$  va  $y$  o'zgaruvchilar orasidagi bog'lanish  $F(x, y) = 0$  tenglama yordamida bo'ladi. Odada bunday berilgan (aniqlangan) funksiya oshkormas ko'rinishda berilgan funksiya (yoki oshkormas funksiya) deb ataladi va

$$x \rightarrow y : F(x, y) = 0.$$

kabi belgilanadi.

**13.10-misol** Ushbu

$$F(x, y) = y\sqrt{x^2 - 1} - 2 = 0 \quad (13.38)$$

tenglamaning funksiya aniqlashi ko'rsatilsin.

◀ Ravshanki.

$$F(x, y) = y\sqrt{x^2 - 1} - 2 = 0$$

tenglama  $x$  ning  $R \setminus \{x \in R : -1 \leq x \leq 1\}$  dan olingan har bir qiymatida yagona

$$y = \frac{2}{\sqrt{x^2 - 1}}$$

echimga ega, bundan

$$F\left(x, \frac{2}{\sqrt{x^2 - 1}}\right) = 0.$$

Natijada (13.38) tenglama yordamida berilgan ushbu

$$x \rightarrow y = \frac{2}{\sqrt{x^2 - 1}} : F\left(x, \frac{2}{\sqrt{x^2 - 1}}\right) = 0$$

oshkormas ko'rinishdagi funksiya ega bo'lamiz. ▶

### 13.11-misol. Ushbu

$$F(x, y) = x - y + \frac{1}{2} \sin y = 0 \quad (13.39)$$

tenglamani funksiya aniqlashi ko'rsatilsin.

◀ Bu tenglamani

$$x = y - \frac{1}{2} \sin y = \phi(y)$$

ko'rinishda yozib olamiz. Ravshanki,  $\phi(y)$  funksiya  $(-\infty, +\infty)$  da uzlusiz va  $\phi'(y) = 1 - \frac{1}{2} \cos y > 0$  hosilaga ega.

Unda teskari funksiya haqida teoremaga ko'ra (1-qism, 5-bob, 7-§)  $y = \phi^{-1}(x)$  funksiya mavjuddir. Demak,  $(-\infty, +\infty)$  dan olingan  $x$  ning har bir qiymatida (13.39) tenglama yagona  $y = \phi^{-1}(x)$  echimga ega, bundan

$$F\left(x, \phi^{-1}(x)\right) = 0.$$

Har bir  $x$  ga  $\phi^{-1}(x)$  ni mos qo'yib,

$$x \rightarrow \phi^{-1}(x) : F\left(x, \phi^{-1}(x)\right) = 0$$

oshkormas ko'rinishdagi funksiyaga ega ho'lamiz. ▶

### 13.12-misol. Quyidagi

$$F(x, y) = x^2 + y^2 - \ln y = 0 \quad (y > 0)$$

tenglamani funksiya aniqmasligi ko'rsatilsin.

◀ Bu tenglama  $x$  ning  $(-\infty, +\infty)$  oraliqdan olingan hech bir qiymatida echimga ega emas. Chunki har doim  $y^2 - \ln y > 0$ . Bu holda berilgan tenglama yordamida funksiya aniqlanmaydi. ▶

2. Oshkormas funksiyaning mavjudligi. Biz yuqorida

$$F(x, y) = 0$$

tenglama yordamida har doim oshkormas ko'rinishdagi funksiya aniqlanavermasligini ko'rdik.

Endi tenglama, ya'ni  $F(x, y)$  funksiya qanday shartlarni bajarganda oshkormas ko'rinishdagi funksiyaning aniqlanishi, boshqacha aytganda, oshkormas ko'rinishdagi funksiyaning mavjud bo'lishi masalasi bilan shug'ullanamiz.

**II-teorema.**  $F(x, y)$  funksiya  $(x_0, y_0) \in R^2$  nuqtanining biror

$$U_{h,k}((x_0, y_0)) = \{(x, y) \in R^2 : x^0 - h < x < x_0 + h, y_0 - k < y < y_0 + k\}$$

atrofida ( $h > 0, k > 0$ ) berilgan va u quyidagi shartlarni bajarsin:

1)  $U_{h,k}((x_0, y_0))$  da uzlusiz;

2)  $x$  o'zgaruvchining  $(x_0 - h, x_0 + h)$  oraliqdan olingan har bir tayin qiyamatida  $y$  o'zgaruvchining funksiyasi sifatida o'suvchi;

3)  $F(x_0, y_0) = 0$ .

U holda  $(x_0, y_0)$  ning shunday

$$U_{\delta,\varepsilon}((x_0, y_0)) = \{(x, y) \in R^2 : x_0 - \delta < x < x_0 + \delta, y_0 - \varepsilon < y < y_0 + \varepsilon\}$$

atrofi ( $0 < \delta < h, 0 < \varepsilon < k$ ) topiladiki,

1')  $\forall x \in (x_0 - \delta, x_0 + \delta)$  uchun

$$F(x, y) = 0$$

tenglama yagona  $y$  echimiga ( $y \in (y_0 - \varepsilon, y_0 + \varepsilon)$ ) ega, ya'ni  $F(x, y) = 0$  tenglama yordamida

$$x \rightarrow y : F(x, y) = 0$$

oshkormas ko'rinishdagi funksiya aniqlanadi,

2')  $x = x_0$  bo'lganda unga mos kelgan  $y$  uchun  $y = y_0$  bo'ladi,

3') oshkormas ko'rinishda aniqlangan

$$x \rightarrow y : F(x, y) = 0$$

funksiya  $(x_0 - \delta, x_0 + \delta)$  oraliqda uzlusiz bo'ladi.

$\blacktriangleleft U_{h,k}((x_0, y_0))$  atrofga tegishli bo'lgan  $(x_0, y_0 - \varepsilon), (x_0, y_0 + \varepsilon)$  nuqtalarni olaylik. Ravshanki,  $[y_0 - \varepsilon, y_0 + \varepsilon]$  oraliqda  $F(x_0, y)$  funksiya o'suvchi bo'ladi. Demak,

$$y_0 - \varepsilon < y_0 \Rightarrow F(x_0, y_0 - \varepsilon) < F(x_0, y_0).$$

$$y_0 + \varepsilon > y_0 \Rightarrow F(x_0, y_0 + \varepsilon) > F(x_0, y_0).$$

Teoremaning 3-shartiga ko'ra

$$F(x_0, y_0 - \varepsilon) < 0, F(x_0, y_0 + \varepsilon) > 0$$

bo'ladi.

Teoremaning 1-shartiga ko'ra  $F(x_0, y)$  funksiya  $U_{h,k}((x_0, y_0))$  da uzlusiz. Binobarin,  $F(x, y_0 - \varepsilon)$  va  $F(x, y_0 + \varepsilon)$  funksiyalar  $(x_0 - h, x_0 + h)$  oraliqda uzlusiz bo'ladi. Unda uzlusiz funksiyaning xossasiga ko'ra (qaralsin, 1-qism, 5-bob, 7-§)  $x_0$  nuqtanining shunday atrofi  $(x_0 - \delta, x_0 + \delta)$  topiladiki, ( $0 < \delta < h$ ).  $\forall x \in (x_0 - \delta, x_0 + \delta)$  uchun  $F(x, y_0 - \varepsilon) < 0, F(x, y_0 + \varepsilon) > 0$  bo'ladi.

Ravshanki,  $(x_0, y_0)$  nuqtanining ushbu

$U_{\delta,\varepsilon}((x_0, y_0)) = \{(x, y) \in R^2 : x_0 - \delta < x < x_0 + \delta; y_0 - \varepsilon < y < y_0 + \varepsilon\}$

atrofi uchun teoremaning barcha shartlari bajarilaveradi. chunki

$$U_{\delta,\varepsilon}((x_0, y_0)) \subset U_{h,k}((x_0, y_0))$$

$\forall x^* \in (x_0 - \delta, x_0 + \delta)$  nuqtani olib,  $F(x^*, y)$  funksiyani qaraylik. Bu funksiya, yuqorida aytildiganiga ko'ra  $[y_0 - \varepsilon, y_0 + \varepsilon]$  oraliqda uzluksiz va uning chetki nuqtalarida turli ishorali qiymatlarga ega:

$$F(x^*, y_0 - \varepsilon) < 0, \quad F(x^*, y_0 + \varepsilon) > 0.$$

U holda Boltsano-Koshining birinchi teoremasiga ko'ra (qaralsin, I-qism, 5-bob, 7-§) shunday  $y^*$  topiladiki ( $y^* \in (y_0 - \varepsilon, y_0 + \varepsilon)$ )

$$F(x^*, y^*) = 0$$

bo'ladi. Bu topilgan  $y^*$  yagona bo'ladi. Haqiqatdan ham,

$$y \neq y^* \Rightarrow F(x^*, y) \neq F(x^*, y^*) \quad (y \in [y_0 - \varepsilon, y_0 + \varepsilon])$$

chunki,  $F(x^*, y)$  o'suvchi bo'lganligi sababli  $y > y^*$  uchun  $F(x^*, y) > F(x^*, y^*)$  va  $y < y^*$  uchun  $F(x^*, y) < F(x^*, y^*)$  bo'ladi.

Shunday qilib,  $x$  ning  $(x_0 - \delta, x_0 + \delta)$  oraliqdan olingen har bir qiymatida  $F(x, y) = 0$  tenglama yagona  $y$  echimiga ega ekanligi ko'rsatildi. Bu esa  $F(x, y) = 0$  tenglama yordamida

$$x \rightarrow y : F(x, y) = 0 \quad (13.40)$$

oshkormas ko'rinishdagi funksiya aniqlanganligini bildiradi.

$x = x_0$  bo'lsin. Unda teoremaning 3-sharti  $F(x_0, y_0) = 0$  dan  $x_0$  ga  $y_0$  ni mos quyilgandagina:

$$x_0 \rightarrow y_0 : F(x, y) = 0.$$

Demak,  $x = x_0$  da oshirmsas funksiyaning qiymati  $y_0$  ga teng bo'ladi.

Endi oshkormas funksiyaning  $(x_0 - \delta, x_0 + \delta)$  oraliqda uzluksiz bo'llishini ko'rsatamiz.

Ravshanki,  $x \in (x_0 - \delta, x_0 + \delta)$  ga mos qo'yiladigan  $y \in (y_0 - \varepsilon, y_0 + \varepsilon)$  bo'ladi. Bu esa oshkormas funksiyaning  $x = x_0$  nuqtada uzluksiz ekanligini bildiradi.

Oshkormas funksiyaning  $\forall x^* \in (x_0 - \delta, x_0 + \delta)$  nuqtada uzluksiz bo'llishini ko'rsatish bu funksiyaning  $x_0$  nuqtada uzluksiz bo'llishini ko'rsatish kabitidir.

Haqiqatdan ham,  $F(x, y) = 0$  tenglama  $(x_0, y_0)$  nuqtaning atrofi  $U_{\delta,\varepsilon}((x_0, y_0))$  da oshkormas funksiyani aniqlaganligidan, shunday  $y^* \in (y_0 - \varepsilon, y_0 + \varepsilon)$  topiladiki,  $F(x^*, y^*) = 0$  bo'ladi. Yuqoridagi mulohazani  $(x^*, y^*)$  nuqtaga nisbatan yuritib,  $F(x, y) = 0$  tenglama  $(x^*, y^*)$  nuqtaning atrofida oshkormas ko'rinishdagi funksiyani aniqlashini (bu aniqlangan funksiya (13.40) ning o'zi bo'ladi), uni  $x^*$  nuqtada uzluksiz bo'llishini topamiz. Demak, oshkormas funksiya  $(x_0 - \delta, x_0 + \delta)$  oraliqda uzluksiz bo'ladi. ▶

**3-eslatma.** Yuqoridagi 11-teorema  $F(x, y)$  funksiya  $x$  o'zgaruvchining  $(x_0 - h, x_0 + h)$  oraliqdan olingan har bir tayin qiymatida  $y$  o'zgaruvchining funksiyasi sifatida kamayuvchi bo'lгanda ham o'rинli bo'ladi.

**12-teorema.**  $F(x, y)$  funksiya  $(x_0, y_0) \in R^2$  nuqtaning biror  $U_{h,k}((x_0, y_0))$  atrofida ( $h > 0, k > 0$ ) berilgan va u quyidagi shartlarni bajarsin:

1)  $U_{h,k}((x_0, y_0))$  va uzliksiz;

2)  $y$  o'zgaruvchining  $(y_0 - k, y_0 + k)$  oraliqdan olingan har bir tayin qiymatida  $x$  o'zgaruvchining funksiyasi sifatida o'suvchi (kamayuvchi);

3)  $F(x_0, y_0) = 0$ .

U holda  $(x_0, y_0)$  nuqtaning shunday

$$U_{\delta,\varepsilon}((x_0, y_0)) = \{ (x, y) \in R^2 : x_0 - \delta < x < x_0 + \delta; y_0 - \varepsilon < y < y_0 + \varepsilon \}$$

atrofi ( $0 < \delta < h, 0 < \varepsilon < k$ ) topiladiki.

1')  $\forall y \in (y_0 - \varepsilon, y_0 + \varepsilon)$  uchun

$$F(x, y) = 0$$

tenglama yagona  $x (x \in (x_0 - \delta, x_0 + \delta))$  echimga ega, ya'ni  $F(x, y) = 0$  tenglama yordamida  $y \rightarrow x : F(x, y) = 0$  oshkormas ko'rinishdagi funksiya aniqlanadi;

2')  $y = y_0$  bo'lгanda unga mos kelgan  $x$  uchun  $x = x_0$  bo'ladi;

3') oshkormas ko'rinishda aniqlangan funksiya

$$y \rightarrow x : F(x, y) = 0$$

$(y_0 - \varepsilon, y_0 + \varepsilon)$  da uzliksiz bo'ladi.

Bu teoremaning isboti yuqorida keltirilgan 11-teoremaning isboti kabidir.

**3'. Oshkormas funksiyaning hosilasi.** Endi oshkormas funksiyaning hosilasini topish bilan shug'ullanamiz.

**13-teorema.**  $F(x, y)$  funksiya  $(x_0, y_0) \in R^2$  nuqtaning biror

$$U_{h,k}((x_0, y_0)) = \{ (x, y) \in R^2 : x_0 - h < x < x_0 + h; y_0 - k < y < y_0 + k \}$$

atrofida ( $h > 0, k > 0$ ) berilgan va u quyidagi shartlarni bajarsin:

1)  $U_{h,k}((x_0, y_0))$  da uzliksiz;

2)  $U_{h,k}((x_0, y_0))$  da uzliksiz  $F'_x(x, y), F'_y(x, y)$  xususiy hosilalarga ega va  $F'_y(x_0, y_0) \neq 0$ ;

3)  $F(x_0, y_0) = 0$ .

U holda  $(x_0, y_0)$  nuqtaning shunday

$$U_{\delta,\varepsilon}((x_0, y_0)) = \{ (x, y) \in R^2 : x_0 - \delta < x < x_0 + \delta; y_0 - \varepsilon < y < y_0 + \varepsilon \} \text{ atrofi}$$

$(0 < \delta < h, 0 < \varepsilon < k)$  topiladiki,

1')  $\forall x \in (x_0 - \delta, x_0 + \delta)$  uchun

$$F(x, y) = 0$$

tenglama yagona  $y$  echimga  $y \in (y_0 - \varepsilon, y_0 + \varepsilon)$  ega, ya'ni  $F(x, y) = 0$  tenglama yordamida

$$x \rightarrow y : F(x, y) = 0$$

oshkormas ko'rinishdagi funksiya aniqlanadi;

2')  $x = x_0$  bo'lganda unga mos keladigan  $y$  uchun  $y = y_0$  bo'ladi;

3') oshkormas ko'rinishda aniqlangan

$$x \rightarrow y : F(x, y) = 0$$

funksiya  $(x_0 - \delta, x_0 + \delta)$  oraliqda uzlaksiz bo'ladi;

4') Bu oshkormas ko'rinishdagi funksiya  $(x_0 - \delta, x_0 + \delta)$  oraliqda uzlaksiz hosilaga ega bo'ladi.

► Shartga ko'ra  $F'_y(x, y)$  funksiya  $U_{h,k}((x_0, y_0))$  da uzlaksiz va  $F'_y(x_0, y_0) \neq 0$ . Aniqlik uchun  $F'_y(x_0, y_0) > 0$  deylik. U holda uzlaksiz funksiyaning xossasiga ko'ra  $(x_0, y_0)$  nuqtaning shunday

$$U_{\delta,\varepsilon}((x_0, y_0)) = \{(x, y) \in R^2 : x_0 - \delta < x < x_0 + \delta, y_0 - \varepsilon < y < y_0 + \varepsilon\}$$

atrofi ( $0 < \delta < h, 0 < \varepsilon < k$ ) topiladiki,  $\forall (x, y) \in U_{\delta,\varepsilon}((x_0, y_0))$  uchun  $F'_y(x, y) > 0$  bo'ladi. Demak,  $F(x, y)$  funksiya  $x$  o'zgaruvchining  $(x_0 - \delta, x_0 + \delta)$  oraliqdan olingan har bir tayin qiymatida  $y$  o'zgaruvchining funksiyasi sifatida o'suvchi. Yuqorida isbot etilgan 11-teoreemaga ko'ra

$$F(x, y) = 0$$

tenglama  $(x_0 - \delta, x_0 + \delta)$  da

$$x \rightarrow y : F(x, y) = 0$$

oshkormas ko'rinishdagi funksiyani aniqlaydi,  $x = x_0$  bo'lganda unga mos kelgan  $y = y_0$  bo'ladi va oshkormas funksiya  $(x_0 - \delta, x_0 + \delta)$  da uzlaksiz bo'ladi.

Endi oshkormas funksiyaning hosilasini topamiz,  $x_0$  nuqtaga shunday  $\Delta x$  orttirma beraylikki,  $x_0 + \Delta x \in (x_0 - \delta, x_0 + \delta)$  bo'lsin. Natijada

$$x \rightarrow y : F(x, y) = 0$$

oshkormas funksiya ham orttirmaga ega bo'lib,

$$F(x_0 + \Delta x, y_0 + \Delta y) = 0$$

bo'ladi. Demak,

$$\Delta F(x_0, y_0) = F(x_0 + \Delta x, y_0 + \Delta y) - F(x_0, y_0) = 0 \quad (13.41)$$

Shartga ko'ra  $F'_x(x, y)$  va  $F'_y(x, y)$  xususiy hosilalar  $U_{\delta,\varepsilon}((x_0, y_0))$  da uzlaksiz. Binobarin  $F(x, y)$  funksiya  $(x_0, y_0)$  nuqtada differentiallanuvchi:

$$\Delta F(x_0, y_0) = F'_x(x_0, y_0)\Delta x + F'_y(x_0, y_0)\Delta y + \alpha\Delta x + \beta\Delta y \quad (13.42)$$

Bu munosabatdagi  $\alpha$  va  $\beta$  lar  $\Delta x$  va  $\Delta y$  larga bog'liq va  $\Delta x \rightarrow 0, \Delta y \rightarrow 0$  da  $\alpha \rightarrow 0, \beta \rightarrow 0$ .

(13.41) va (13.42) munosabatlardan

$$\frac{\Delta y}{\Delta x} = -\frac{F'_x(x_0, y_0) + \alpha}{F'_y(x_0, y_0) + \beta}$$

ekanligi kelib chiqadi.

Oshkormas funksiyaning  $x_0$  nuqtada uzlaksizligini e'tiborga olib, keyingi tenglikda  $\Delta x \rightarrow 0$  da limitga o'tib quyidagini topamiz:

$$\lim_{\Delta x \rightarrow 0} \frac{\Delta y}{\Delta x} = \lim_{\Delta x \rightarrow 0} \left( -\frac{F'_x(x_0, y_0) + \alpha}{F'_y(x_0, y_0) + \beta} \right) = -\frac{F'_x(x_0, y_0)}{F'_y(x_0, y_0)}$$

Demak,

$$y'_{x=x_0} = -\frac{F'_x(x_0, y_0)}{F'_y(x_0, y_0)}.$$

$U_{\delta, \varepsilon}((x_0, y_0))$  da  $F'_x(x, y)$   $F'_y(x, y)$  xususiy hosilalar uzuksiz va  $F'_y(x, y) \neq 0$  bo'lishidan oshkormas funksiyaning hosilasi

$$y' = -\frac{F'_x(x, y)}{F'_y(x, y)}$$

ning  $(x_0 - \delta, x_0 + \delta)$  oraliqda uzuksiz bo'lishi kelib chiqadi. ▶

### 13.13-misol. Ushbu

$$F(x, y) = xe^y + ye^x - 2 = 0 \quad (13.43)$$

tenglama bilan aniqlanadigan oshkormas funksiyaning hosilasi topilsin.

◀ Ravshanki,  $F(x, y) = xe^y + ye^x - 2$  funksiya  $\{(x, y) \in R^2 : -\infty < x < +\infty, -\infty < y < +\infty\}$  to'plamda yuqoridagi 11-teoremaning barcha shartlarini qanoat-lantiradi. Demak,  $\forall (x_0, y_0) \in R^2$  nuqtaning  $U_{\delta, \varepsilon}((x_0, y_0))$  atrofida (13.43) tenglama oshkormas ko'rinishdagi funksiyani aniqlaydi va bu oshkormas funksiyaning hosilasi

$$y' = -\frac{F'_x(x, y)}{F'_y(x, y)} = -\frac{e^y + ye^x}{xe^y + e^x}$$

bo'ladidi. ▶

Oshkormas ko'rinishdagi funksiyaning hosilasini quyidagicha ham hisoblasa bo'ladidi.  $y$  ning  $x$  ga bog'liq ekanini e'tiborga olib,  $F(x, y) = 0$  dan topamiz:

$$F'_x(x, y) + F'_y(x, y) \cdot y' = 0.$$

Bundan esa

$$y' = -\frac{F'_x(x, y)}{F'_y(x, y)}$$

bo'lishi kelib chiqadi.

Yuqorida keltirilgan (13.43) tenglama yordamida aniqlangan oshkormas ko'rinishdagi funksiyaning hosilasini hisoblaylik:

$$F'_x(x, y) + F'_y(x, y) \cdot y' = e^y + ye^x + (xe^y + e^x)y' = 0$$

$$y' = -\frac{e^y + ye^x}{xe^y + e^x}.$$

4°. Oshkormas funksiyaning yuqori tartibili hositalari. Faraz qilaylik,  
 $F(x, y) = 0$

tenglama  $(x_0, y_0) \in R^2$  nuqtanining  $U_{\delta, \epsilon}((x_0, y_0))$  atrosida oshkormas ko'rinishdag'i funksiyani aniqlasini. Ma'lumki,  $F(x, y)$  funksiya  $U_{\delta, \epsilon}((x_0, y_0))$  da uzlusiz  $F'_x(x, y), F'_y(x, y)$  xususiy hosilalarga ( $F'_y(x, y) \neq 0$ ) ega bo'lsa, oshkormas ko'rinishdag'i funksiya uzlusiz hosilaga ega bo'lib,

$$y' = -\frac{F'_x(x, y)}{F'_y(x, y)} \quad (13.44)$$

bo'ldi.

Endi  $F(x, y)$  funksiya  $U_{\delta, \epsilon}((x_0, y_0))$  da uzlusiz ikkinchi tartibili  $F''_{xx}(x, y), F''_{yy}(x, y), F''_{xy}(x, y)$  xususiy hosilalarga ega bo'lsin, y ning x ga bog'liqligini e'tiborga olib, (13.44) tenglikni x bo'yicha differensiallab quyidagi topamiz:

$$y'' = -\frac{\left(F'_x(x, y)\right)' \cdot F'_y(x, y) - \left(F'_y(x, y)\right)' \cdot F'_x(x, y)}{\left(F'_y(x, y)\right)^2}.$$

Agar

$$\begin{aligned} (F'_x(x, y))' &= F''_{xx}(x, y) + F''_{xy}(x, y) \cdot y', \\ (F'_y(x, y))' &= F''_{yy}(x, y) + F''_{xy}(x, y) \cdot y' \end{aligned} \quad (13.45)$$

ekanligini hisobga olsak, unda

$$\begin{aligned} y'' &= \frac{\left(F''_{xx}(x, y) + F''_{xy}(x, y) \cdot y'\right) F'_y(x, y) - \left(F''_{yy}(x, y) + F''_{xy}(x, y) \cdot y'\right) \cdot F'_x(x, y)}{\left(F'_y(x, y)\right)^2} = \\ &= \frac{F''_{yx}(x, y) \cdot F'_x(x, y) - F''_{xy}(x, y) \cdot F'_y(x, y) + \left[F''_{yy}(x, y) \cdot F'_x(x, y) - F''_{xy}(x, y) \cdot F'_y(x, y)\right] y'}{\left(F'_y(x, y)\right)^2} \end{aligned}$$

bo'ldi. Bu ifodadagi  $y'$  ning o'mniga qiymati  $-\frac{F'_x(x, y)}{F'_y(x, y)}$  ni qo'yib, oshkormas ko'rinishdag'i funksiyaning ikkinchi tartibili hosilasi uchun quyidagi formulaga kelamiz:

$$y'' = \frac{2F'_x(x, y) \cdot F'_y(x, y) \cdot F''_{yx}(x, y) - F''_{y^2}(x, y) \cdot F''_{xx}(x, y) \cdot F''_{xy}(x, y)}{\left(F'_y(x, y)\right)^3}$$

Xuddi shu yo'l bilan oshkormas funksiyaning uchinchi va xokazo tartibdagi hosilalari topiladi.

**4-eslatma.** Ushbu

$$F(x, y) = 0$$

tenglama bilan aniqlangan oshkormas ko'rinishdag'i funksiyaning yuqori tartibili hosilalarini quyidagicha ham hisoblasa bo'ladi.  $F(x, y) = 0$  ni differensiallab,

$$F'_x(x, y) + F'_y(x, y)y' = 0$$

bo'lishini topgan edik. Buni yana bir marta differensiallaymiz:

$$(F'_x(x, y))'_x + (F'_y(x, y)y')'_x = \\ = (F''_{xx}(x, y))'_x + y'(F''_{xy}(x, y))'_x + F''_{yy}(x, y)y'' = 0.$$

Yuqoridagi (13.45) munosabatdan foydalansak, u holda ushbu

$$F''_{xx}(x, y) + 2F''_{yx}(x, y) + F''_{yy}(x, y)y'^2 + F'_y(x, y)y'' = 0$$

tenglikka kelamiz. Undan esa

$$y'' = -\frac{F''_{xx}(x, y) + 2F''_{yx}(x, y)y' + F''_{yy}(x, y)y'^2}{F'_y(x, y)}$$

bo'lishi kelib chiqadi. Bu tenglikdagi  $y'$  ning o'mniga uning qiymati  $-\frac{F'_x(x, y)}{F'_y(x, y)}$  ni qo'yak, unda

$$y'' = \frac{2F'_x(x, y) \cdot F'_y(x, y) F''_{yy}(x, y) - F'^2_y(x, y) \cdot F''_{xy}(x, y) - F'^2_x(x, y) F''_{yx}(x, y)}{(F'_y(x, y))^3}$$

bo'ladi.

### 13.13-misol. Ushbu

$$F(x, y) = xe^y + ye^x - 2 = 0$$

tenglama yordamida aniqlangan oshkormas funksiyaning ikkinchi tartibili hosilasi topilsin.

◀ Berilgan tenglamadan, differensiallash bilan

$$e^y + ye^x + (xe^y + e^x)y' = 0$$

bo'lishini topgan edik. Buni yana bir marta differensiallab topamiz:

$$e^y \cdot y' + y'e^x + ye^x + e^y y' + xe^y y' \cdot y' + xe^y y'' + y''e^x + y'e^x = 0$$

ya'ni

$$y''(xe^y + e^x) + 2e^y y' + 2e^x y' + xe^y y'^2 + ye^x = 0.$$

Bundan esa

$$y'' = -\frac{2e^y y' + 2e^x y' + xe^y y'^2 + ye^x}{xe^y + e^x}$$

bo'lishi kelib chiqadi. Bu tenglikdagi  $y'$  ning o'mniga uning qiymati

$$y' = -\frac{e^y + ye^x}{e^x + xe^y}$$

ni qo'yib, oshkormas funksiyaning ikkinchi tartibili hosilasini topamiz. ▶

5°. Ko'p o'zgaruvchili oshkormas funksiyalar. Ko'p o'zgaruvchili oshkormas ko'rinishdagi funksiya tushunchasi yuqorida o'rganilgan bir o'zgaruvchili oshkormas ko'rinishdagi funksiya tushunchasi kabi kiritiladi.

$F(x, y) = F(x_1, x_2, \dots, x_m, y)$  funksiya ( $x = (x_1, x_2, \dots, x_m) \in R^m$ )

$$M = \{(x, y) \in R^{m+1} : a_1 < x_1 < b_1, a_2 < x_2 < b_2, \dots, a_m < x_m < b_m, c < y < d\}$$

to'plamda berilgan bo'lisin. Ushbu

$$F(x, y) = F(x_1, x_2, \dots, x_m, y) = 0 \quad (13.46)$$

tenglamani qaraylik.

$x \in R^n$  nuqtalardan ihorat shunday  $X$  to'plamni ( $X \subset R^m$ ) qaraylikki, bu to'plamdan olingan har bir nuqtada (13.46) tenglama yagona haqiqiy echimiga ega bo'lisin. Endi  $x$  nuqtani olib, bu nuqtaga (13.46) tenglamaning yagona echimi bo'lgan  $y$  ni mos qo'yamiz. Natijada  $X$  to'plamdan olingan har bir  $x$  nuqtaga, yuqorida ko'rsatilgan qoidaga ko'ra, bitta  $y$  mos qo'yilib, funksiya hosil bo'ladi. Bunday aniqlangan funksiya ko'p o'zgaruvchili ( $m$  ta o'zgaruvchili) oshkormas ko'rinishda berilgan funksiya deb ataladi va

$$(x_1, x_2, \dots, x_m) \rightarrow y : F(x_1, x_2, \dots, x_m, y) = 0$$

yoki

$$x \rightarrow y : F(x, y) = 0$$

kabi belgilanadi.

### 13.14-misol. Ushbu

$$F(x_1, x_2, y) = x_1^2 x_2 - x_2^2 y + x_1 y = 0$$

tenglama oshkormas funksiyani aniqlashi ko'rsatilsin.

◀ Ravshanki,

$$F(x_1, x_2, y) = x_1^2 x_2 - x_2^2 y + x_1 y = 0$$

tenglama  $R^2 \setminus \{(x_1, x_2) \in R^2 : x_1 = x_2\}$  to'plamda olingan har bir  $(x_1, x_2)$  nuqtada yagona

$$y = \frac{x_1^2 x_2}{x_2^2 - x_1}$$

echimga ega. ya'ni

$$F\left(x_1, x_2, \frac{x_1^2 x_2}{x_2^2 - x_1}\right) = 0.$$

Demak, berilgan tenglama yordamida  $x_1, x_2$  o'zgaruvchilaming oshkormas ko'rinishdagi funksiyasi aniqlanadi:

$$(x_1, x_2) \rightarrow \frac{x_1^2 x_2}{x_2^2 - x_1} : F\left(x_1, x_2, \frac{x_1^2 x_2}{x_2^2 - x_1}\right) = 0 \blacktriangleright$$

Endi ko'p o'zgaruvchili oshkormas ko'rinishdagi funksiyaning mavjudligi, uzluksizligi hamda hosilalarga ega bo'lishi haqida teoremlarni keltiramiz.

**14-teorema.**  $F(x, y) = F(x_1, x_2, \dots, x_m, y)$  funksiya  $\left(x^0, y_0\right) = (x_1^0, x_2^0, \dots, x_m^0, y_0) \in R^{m+1}$  nuqtanining biror  $U_{h_1, h_2, \dots, h_m}(\{x^0, y_0\}) = \{(x_1^0, x_2^0, \dots, x_m^0, y_0) \in R^{m+1} : x_i^0 - h_i < x_i < x_i^0 + h_i, x_2^0 - h_2 < x_2 < x_2^0 + h_2, \dots, x_m^0 - h_m < x_m < x_m^0 + h_m, y_0 - k < y < y_0 + k\}$  atrofida ( $h_i > 0; i = 1, 2, \dots, m; k > 0$ ) berilgan va u quyidagi shartlarni bajarsin:

1)  $U_{h_1, h_2, \dots, h_m}(\{x^0, y_0\})$  da uzluksiz;

2)  $x = (x_1, x_2, \dots, x_m)$  o'zgaruvchining

$$\begin{aligned} &\{(x_1, x_2, \dots, x_m) \in R^m : x_1^0 - h_1 < x_1 < x_1^0 + h_1, x_2^0 - h_2 < x_2 < x_2^0 + h_2, \dots, \\ &x_m^0 - h_m < x_m < x_m^0 + h_m\} \end{aligned}$$

to'plamdan olingan har bir tayin qiymatida  $y$  o'zgaruvchining funksiyasi sifatida o'suvchi (kamayuvchi):

$$3) F(x^0, y_0) = 0.$$

U holda  $(x^0, y_0)$  nuqtaning shunday

$$U_{\delta_1, \delta_2, \dots, \delta_m}((x^0, y_0)) = \{(x_1, x_2, \dots, x_m, y) \in R^{m+1} : x_i^0 - \delta_i < x_i < x_i^0 + \delta_i, i = 1, 2, \dots, m\}$$

$$\{x_m^0 - \delta_m < x_m < x_m^0 + \delta_m, y_0 - \varepsilon < y < y_0 + \varepsilon\} \text{ atrofi } (0 < \delta_i < h, i = 1, 2, \dots, m).$$

$0 < \varepsilon < k$  topiladiki,

$$1') \forall x \in \{(x_1, x_2, \dots, x_m) \in R^m : x_i^0 - \delta_i < x_i < x_i^0 + \delta_i, \dots, x_m^0 - \delta_m < x_m < x_m^0 + \delta_m\}$$

uchun

$$F(x, y) = 0 \quad (13.47)$$

tenglama yagona  $y(y \in (y_0 - \varepsilon, y_0 + \varepsilon))$  echinga ega, ya'ni (13.47) tenglama  $x \rightarrow y : F(x, y) = 0$  oshkormas ko'rinishdagi funksiyani aniqlaydi:

2')  $x = x^0$  bo'lganda, unga mos kelgan  $y = y_0$  bo'ladi:

3') oshkormas ko'rinishda aniqlangan

$$x \rightarrow y : F(x, y) = 0$$

funksiya

$$\begin{aligned} &\{(x_1, x_2, \dots, x_m) \in R^m : x_1^0 - \delta_1 < x_1 < x_1^0 + \delta_1, x_2^0 - \delta_2 < x_2 < x_2^0 + \delta_2, \dots, \\ &x_m^0 - \delta_m < x_m < x_m^0 + \delta_m\} \end{aligned}$$

to'plamda uzlusiz bo'ladi.

**15-teorema.**  $F(x, y)$  funksiya  $(x^0, y_0) \in R^{m+1}$  nuqtaning biror  $U_{h_1, h_2, \dots, h_m}((x^0, y_0))$  atrofida berilgan va u quyidagi shartlarni bajarsin:

1)  $U_{\delta_1, \delta_2, \dots, \delta_m}((x^0, y_0))$  da uzlusiz;

2)  $U_{\delta_1, \delta_2, \dots, \delta_m}((x^0, y_0))$  da uzlusiz  $F'_x(x_1, x_2, \dots, x_m, y)$  ( $i = 1, 2, 3, \dots, m$ )

$F'_y(x_1, x_2, \dots, x_m, y)$  xususiy hosilalarga ega va  $F'_y(x_1, x_2, \dots, x_m, y) \neq 0$

$$3) F(x^0, y_0) = 0.$$

U holda  $(x^0, y_0)$  nuqtaning shunday  $U_{\delta_1, \delta_2, \dots, \delta_m}((x^0, y_0))$  atrofi ( $0 < \delta_i < h, i = 1, 2, \dots, m, 0 < \varepsilon < k$ ) topiladiki,

$$1') \forall x \in \{(x_1, x_2, \dots, x_m) \in R^m : x_1^0 - \delta_1 < x_1 < x_1^0 + \delta_1, x_2^0 - \delta_2 < x_2 < x_2^0 + \delta_2, \dots, \\ x_m^0 - \delta_m < x_m < x_m^0 + \delta_m\} \text{ uchun}$$

$$F(x, y) = 0$$

tenglama yagona  $y(y \in (y_0 - \varepsilon, y_0 + \varepsilon))$  echinga ega, ya'ni (13.47) tenglama  $x \rightarrow y : F(x, y) = 0$  oshkormas ko'rinishdagi funksiyani aniqlaydi:

2')  $x = x^0$  bo'lganda, unga mos kelgan  $y = y_0$  bo'ladi:

3') oshkormas ko'rinishda aniqlangan funksiya

$$\begin{aligned} &\{(x_1, x_2, \dots, x_m) \in R^m : x_1^0 - \delta_1 < x_1 < x_1^0 + \delta_1, x_2^0 - \delta_2 < x_2 < x_2^0 + \delta_2, \dots, \\ &x_m^0 - \delta_m < x_m < x_m^0 + \delta_m\} \end{aligned}$$

to'plamda uzlusiz bo'ladi.

4') bu oshkormas ko'rinishdagi funksiya uzlusiz xususiy hosilalarga ega bo'ladi.

Bu teoremlarning isboti yuqorida keltirilgan 12- va 13- teoremlarning isboti kabidir. Ularni isbotlashni o'quvchiga havola etamiz.

Ko'p o'zgaruvchili oshkormas funksiyaning hosilalari ham yuqoridagiga o'xshash hisoblanadi.

Faraz qilaylik,

$$F(x_1, x_2, \dots, x_m, y) = 0$$

tenglama berilgan bo'llib,  $F(x_1, x_2, \dots, x_m, y)$  funksiya 15- teoremaning barcha shartlarini qanoatlantirsin. Bu tenglama aniqlangan oshkormas funksiyaning xususiy hosilalarini topamiz.  $y$  ning  $x_1, x_2, \dots, x_m$  larga bog'liq ekanini e'tiborga olib, (13.47) dan quyidagi larni topamiz.

$$F'_x(x_1, x_2, \dots, x_m, y) + F'_y(x_1, x_2, \dots, x_m, y) \cdot y'_x = 0,$$

$$F'_x(x_1, x_2, \dots, x_m, y) + F'_y(x_1, x_2, \dots, x_m, y) \cdot y'_x = 0,$$

$$\dots$$

$$F'_x(x_1, x_2, \dots, x_m, y) + F'_y(x_1, x_2, \dots, x_m, y) \cdot y'_x = 0.$$

Keyingi tengliklardan esa

$$y'_x = -\frac{F'_x(x_1, x_2, \dots, x_m, y)}{F'_y(x_1, x_2, \dots, x_m, y)},$$

$$y'_x = -\frac{F'_x(x_1, x_2, \dots, x_m, y)}{F'_y(x_1, x_2, \dots, x_m, y)},$$

$$\dots$$

$$y'_x = -\frac{F'_x(x_1, x_2, \dots, x_m, y)}{F'_y(x_1, x_2, \dots, x_m, y)}$$

bo'lishi kelib chiqadi.

$F(x, y)$  funksiya  $U_{a_1, b_1, \dots, a_n, b_n}((x^0, y_0))$  da uzlusiz yuqori tartibli xususiy hosilalarga ega bo'lganda  $F(x, y) = 0$  tenglama aniqlangan oshkormas ko'rinishdagi funksiyaning ham yuqori tartibli hosilalari mavjud bo'ladi.

6'. *Tenglamalar sistemasi bilan aniqlanadigan oshkormas funksiyalar.* Endi tenglamalar sistemasi orqali aniqlanadigan funksiyalar bilan tanishaylik.

$m+n$  ta  $x_1, x_2, \dots, x_m$  va  $y_1, y_2, \dots, y_n$  argumentlarning ushbu  $n$  ta

$$F_i(x_1, x_2, \dots, x_m, y_1, y_2, \dots, y_n) \quad (i = 1, 2, \dots, n)$$

funksiyalari  $R^{m+n}$  fazodagi biror

$$M = \{(x_1, x_2, \dots, x_m, y_1, y_2, \dots, y_n) \in R^{m+n}; a_1 < x_1 < b_1, a_2 < x_2 < b_2, \dots,$$

$$a_m < x_m < b_m; c_1 < y_1 < d_1, c_2 < y_2 < d_2, \dots, c_n < y_n < d_n\}$$

to'plamda berilgan bo'lsin. Quyidagi

$$\begin{aligned} F_1 &= F_1(x_1, x_2, \dots, x_m, y_1, y_2, \dots, y_n) = 0, \\ F_2 &= F_2(x_1, x_2, \dots, x_m, y_1, y_2, \dots, y_n) = 0. \end{aligned} \quad (13.48)$$

$$F_n = F_n(x_1, x_2, \dots, x_m, y_1, y_2, \dots, y_n) = 0$$

tenglamalar sistemasini qaraylik.  $x = (x_1, x_2, \dots, x_m)$  o'zgaruvchining qiymatlaridan iborat shunday

$M_x = \{x = (x_1, x_2, \dots, x_m) \in R^m : a_1 < x_1 < b_1, a_2 < x_2 < b_2, \dots, a_m < x_m < b_m\} \subset R^m$  to'plamni qaraylikki, bu to'plamdan olingan har bir  $x' = (x'_1, x'_2, \dots, x'_m)$  nuqtada (13.48) sistema, ya'ni

$$F_1(x'_1, x'_2, \dots, x'_m, y_1, y_2, \dots, y_n) = 0.$$

$$F_2(x'_1, x'_2, \dots, x'_m, y_1, y_2, \dots, y_n) = 0.$$

$$F_n(x'_1, x'_2, \dots, x'_m, y_1, y_2, \dots, y_n) = 0$$

sistema yagona echimlar sistemasi  $y_1, y_2, \dots, y_n$  ga ega bo'lisin. Endi  $M_x$ , to'plamdan ixtiyoriy  $(x_1, x_2, \dots, x_m)$  nuqtani olib, bu nuqtaga (13.48) tenglamalar sistemasining yagona echimlari sistemasi bo'lgan  $y_1, y_2, \dots, y_n$  ni mos qo'yamiz. Natijada  $M_x$ , to'plamdan olingan har bir  $(x_1, x_2, \dots, x_m)$  ga yuqorida ko'rsatilgan qoidaga ko'ra  $y_1, y_2, \dots, y_n$  lar mos qo'yilib, n ta funksiya hosil bo'ladi. Bunday aniqlangan funksiyalar (13.48) tenglamalar sistemasi yordamida aniqlangan oshkormas ko'rinishdagi funksiyalar deb ataladi.

Qanday shartlar bajarilganda shu (13.48) tenglamalar sistemasi  $y_1, y_2, \dots, y_n$  larning har birini  $x_1, x_2, \dots, x_m$  o'zgaruvchilarining funksiyasi sifatida aniqlashi mumkinligi haqida masala muhim.

Soddarоq holni qaraymiz. Aytaylik, ikki  $F_1 = F_1(x_1, x_2, y_1, y_2)$  va

$$F_2 = F_2(x_1, x_2, y_1, y_2)$$
 funksiya  $(x_1^0, x_2^0, y_1^0, y_2^0) \in R^4$  nuqtaning biror

$$(x_1^0, x_2^0, y_1^0, y_2^0) = (x_1, x_2, y_1, y_2) \in R^4 : x_1^0 - h_1 < x_1 < x_1^0 + h_1,$$

$$x_2^0 - h_2 < x_2 < x_2^0 + h_2, y_1^0 - k_1 < y_1 < y_1^0 + k_1, y_2^0 - k_2 < y_2 < y_2^0 + k_2 \}$$

atrofida ( $h_1 > 0, h_2 > 0, k_1 > 0, k_2 > 0$ ) berilgan bo'lisin. Ushbu

$$F_1 = F_1(x_1, x_2, y_1, y_2) = 0,$$

$$F_2 = F_2(x_1, x_2, y_1, y_2) = 0$$

(13.49)

tenglamalar sistemasini qaraylik.

Faraz qilaylik,  $F_1(x_1, x_2, y_1, y_2)$  va  $F_2(x_1, x_2, y_1, y_2)$  funksiyalar uchun

$$F_1(x_1^0, x_2^0, y_1^0, y_2^0) = 0, \quad F_2(x_1^0, x_2^0, y_1^0, y_2^0) = 0$$

bo'lisin. Bundan tashqari qaratayotgan funksiyalar  $U_{h_1, h_2, k_1, k_2}(x_1^0, x_2^0, y_1^0, y_2^0)$  da uzluksiz barcha xususiy hosilalarga ega va aytaylik,

$$\frac{\partial F_1(x_1^0, x_2^0, y_1^0, y_2^0)}{\partial y_1} \neq 0$$

bo'lsin. U holda 14-teoremaga ko'ra  $(x_1^0, x_2^0, y_1^0, y_2^0)$  nuqtaning shunday  $U_1$  atrofi  $(U_1 \subset U_{\text{sh}, k, k, k}((x_1^0, x_2^0, y_1^0, y_2^0)))$  topiladiki, bu atrofda

$$F_1(x_1, x_2, y_1, y_2) = 0$$

tenglama

$$(x_1, x_2, y_2) \rightarrow y_1 : F_1(x_1, x_2, y_1, y_2) = 0$$

oshkormas ko'rinishdagi funksiyani aniqlaydi. Shu funksiyani

$$y_1 = f_1(x_1, x_2, y_2)$$

deb belgilaylik. Buni (13.49) sistemaning ikkinchi tenglamasidagi  $y_1$  ning o'miga qo'yib quyidagini topamiz:

$$F_2(x_1, x_2, f_1(x_1, x_2), y_2) = 0.$$

Endi

$$\frac{\partial F_2(x_1^0, x_2^0, f_1(x_1^0, x_2^0), y_2^0)}{\partial y_2} \neq 0 \quad (13.50)$$

bo'lsin deylik. U holda yana 14-teoremaga ko'ra  $(x_1^0, x_2^0, y_1^0, y_2^0)$  nuqtaning shunday  $U_2$  atrofi  $(U_2 \subset U_{\text{sh}, k, k, k}((x_1^0, x_2^0, y_1^0, y_2^0)))$  topiladiki, bu atrofda

$$F_2(x_1, x_2, f_1(x_1, x_2), y_2) = 0$$

tenglama

$$(x_1, x_2) \rightarrow y_2 : F_2(x_1, x_2, f_1(x_1, x_2), y_2) = 0$$

oshkormas ko'rinishdagi funksiyani aniqlaydi. Bu funksiyani  $y_2 = f_2(x_1, x_2)$  deb belgilaylik.

Shunday qilib, (13.49) tenglamalar sistemasi  $(x_1^0, x_2^0, y_1^0, y_2^0)$  nuqtaning biror atrofida  $y_1$  va  $y_2$  larni  $x_1, x_2$  o'zgaruvchilarning funksiyasi sifatida aniqlaydi:

$$y_1 = f_1(x_1, x_2, f_2(x_1, x_2))$$

$$y_2 = f_2(x_1, x_2)$$

Ravshanki,  $f_1(x_1^0, x_2^0) f_2(x_1^0, x_2^0) = y_1^0$ ,  $f_2(x_1^0, x_2^0) = y_2^0$ . Yuqoridagi (13.50) shartni quyidagicha yozish mumkin

$$\frac{\partial F_2}{\partial y_2} + \frac{\partial F_1}{\partial y_1} \cdot \frac{\partial y_1}{\partial y_2} \neq 0.$$

Bunda harcha xususiy nosilalar  $(x_1^0, x_2^0, y_1^0, y_2^0)$  nuqtada hisoblangan. Agar

$$\frac{\partial y_1}{\partial y_2} = -\frac{\frac{\partial F_1}{\partial y_1}}{\frac{\partial F_2}{\partial y_2}}$$

ekanini e'tiborga olsak, unda

$$\frac{\partial F_1}{\partial y_2} \cdot \frac{\partial F_1}{\partial y_1} \frac{\partial y_1}{\partial y_2} + \frac{\partial F_1}{\partial y_2} \cdot \frac{\partial F_2}{\partial y_1} \left( -\frac{\frac{\partial F_1}{\partial y_1}}{\frac{\partial F_2}{\partial y_2}} \right) - \frac{\partial F_2}{\partial y_2} \frac{\partial F_1}{\partial y_1} - \frac{\partial F_2}{\partial y_1} \frac{\partial F_1}{\partial y_2} \neq 0$$

bo'ladi. Modomiki,

$$\frac{\partial I_1}{\partial y_1} = 0$$

ekan, unda

$$\frac{\partial F_2}{\partial y_2} \cdot \frac{\partial F_1}{\partial y_1} - \frac{\partial F_2}{\partial y_1} \cdot \frac{\partial F_1}{\partial y_2} \neq 0$$

ya'mi

$$\begin{vmatrix} \frac{\partial F_1}{\partial y_1} & \frac{\partial F_1}{\partial y_2} \\ \frac{\partial F_2}{\partial y_1} & \frac{\partial F_2}{\partial y_2} \end{vmatrix} \neq 0 \quad (13.51)$$

bo'ladi. Shunday qilib, (13.50) munosabatni (13.51) ko'rinishda yozish mumkin ekan.

Natijada ushbu teoremaga kelamiz.

**16-teorema.**  $F_1(x_1, x_2, y_1, y_2)$  va  $F_2(x_1, x_2, y_1, y_2)$  funksiyalar  $(x_1^0, x_2^0, y_1^0, y_2^0) \in R^4$  nuqtaning biror  $U_{h_1, h_2, k_1, k_2}$ , atrofi ( $h_1 > 0, h_2 > 0, k_1 > 0, k_2 > 0$ ) berilgan va ular quyidagi shartlarni bajarsin:

1)  $U_{h_1, h_2, k_1, k_2}((x_1^0, x_2^0, y_1^0, y_2^0))$  da uzliksiz;

2)  $U_{h_1, h_2, k_1, k_2}((x_1^0, x_2^0, y_1^0, y_2^0))$  da barcha xususiy hosilalarga ega va ular uzliksiz;

3) xususiy hosilalarning  $(x_1^0, x_2^0, y_1^0, y_2^0)$  nuqtadagi qiymatlaridan tuzilgan ushbu determinant noldan farqli:

$$\begin{vmatrix} \frac{\partial F_1}{\partial y_1} & \frac{\partial F_1}{\partial y_2} \\ \frac{\partial F_2}{\partial y_1} & \frac{\partial F_2}{\partial y_2} \end{vmatrix} \neq 0$$

4)  $(x_1^0, x_2^0, y_1^0, y_2^0)$  da  $F_1(x_1^0, x_2^0, y_1^0, y_2^0) = 0, F_2(x_1^0, x_2^0, y_1^0, y_2^0) = 0$ .

U holda  $(x_1^0, x_2^0, y_1^0, y_2^0)$  nuqtaning shunday  $U_{\delta_1, \delta_2, \varepsilon_1, \varepsilon_2}((x_1^0, x_2^0, y_1^0, y_2^0))$  atrofi ( $0 < \delta_1 < h_1, 0 < \delta_2 < h_2, 0 < \varepsilon_1 < k_1, 0 < \varepsilon_2 < k_2$ ) topiladi, bu atrofda

I') (13.48) tenglamalar sistemasi oshkormas ko'rinishdag'i

$$y_1 = f_1(x_1, x_2, f_2(x_1, x_2)), \quad y_2 = f_2(x_1, x_2)$$

funksiyalarni aniqlaydi;

2')  $(x_1, x_2) = (x_1^0, x_2^0)$  bo'lganda unga mos keladigan

$$y_1 = y_1^0 = f_1(x_1^0, x_2^0, f_2(x_1^0, x_2^0)), \quad y_2 = y_2^0 = f_2(x_1^0, x_2^0)$$

bo'ladi.

3') oshkormas ko'rinishda aniqlangan  $f_1$  va  $f_2$  funksiya

$$(x_1, x_2) \in R^2 : x_1^0 - \delta_1 < x_1 < x_1^0 + \delta_1, \quad x_2^0 - \delta_2 < x_2 < x_2^0 + \delta_2 \}$$

to'plamda uzliksiz va barcha uzliksiz xususiy hosilalarga ega bo'ladi.

### 13.15-misol. Ushbu

$$\begin{cases} x_1x_2 + y_1y_2 = 1, \\ x_1y_2 - x_2y_1 = 3 \end{cases} \quad (13.52)$$

sistema oshkormas funksiyani aniqlashi ko'rsatilsin.

◀ Bu holda

$$F_1(x_1, x_2) = x_1x_2 + y_1y_2 - 1,$$

$$F_2(x_1, x_2) = x_1y_2 + y_1x_2 - 3$$

ho'lib, bu funksiyalar  $(1, -1, 1, 2)$  nuqtaning atrofida 16-teoremaning barcha shartlarini bajaradi. Haqiqatcan ham,  $F_1(x_1, x_2, y_1, y_2)$ ,  $F_2(x_1, x_2, y_1, y_2)$  funksiyalar uzlusiz, uzlusiz barcha xususiy hosilalarga ega,  $(1, -1, 1, 2)$  nuqtada

$$\left| \begin{array}{cc} \frac{\partial F_1}{\partial y_1} & \frac{\partial F_1}{\partial y_2} \\ \frac{\partial F_2}{\partial y_1} & \frac{\partial F_2}{\partial y_2} \end{array} \right| = \begin{vmatrix} 2 & 1 \\ 1 & 1 \end{vmatrix} = 1 \neq 0$$

hamda

$$F_1(1, -1, 1, 2) = 0, \quad F_2(1, -1, 1, 2) = 0$$

bo'ladi. Demak, (13.51) sistema  $y_1$  va  $y_2$  larni  $x_1, x_2$  o'zgaruvchilarning funksiyasi sifatida aniqlaydi. Ravshanki, bu funksiyalar uzlusiz, xususiy hosilalarga ega. Berilgan (13.52) tenglamalar sistemasi bevosita  $y_1$  va  $y_2$  larga nisbatan echib quyidagi larni topamiz:

$$y_1 = \frac{-3 + \sqrt{9 + 4x_1x_2 - 4x_1^2x_2^2}}{2x_2}, \quad y_2 = \frac{3 + \sqrt{9 + 4x_1x_2 - 4x_1^2x_2^2}}{2x_1}.$$

Endi (13.48) sistemaning oshkormas funksiyalarning aniqlanishini ta'minlaydigan (oshkormas funksiyalarning mavjudligini ifodalaydigan) teoremani isbotsiz keltiramiz.

**17-teorema.**  $F_1, F_2, \dots, F_n$  funksiyalarining har biri  $(x^0, y^0) = (x_1^0, x_2^0, \dots, x_m^0, y_1^0, y_2^0, \dots, y_n^0)$  nuqtaning biror

$$U_{hk}(x^0, y^0) = U_{h_1 h_2 \dots h_m k_1 k_2 \dots k_n}((x_1^0, x_2^0, \dots, x_m^0, y_1^0, y_2^0, \dots, y_n^0)) = (x, y) \in R^{m+n}:$$

$$x_1^0 - h_1 < x_1 < x_1^0 + h_1, \quad x_2^0 - h_2 < x_2 < x_2^0 + h_2, \dots, x_m^0 - h_m < x_m < x_m^0 + h_m.$$

$$y_1^0 - k_1 < y_1 < y_1^0 + k_1, \quad y_2^0 - k_2 < y_2 < y_2^0 + k_2, \dots, y_n^0 - k_n < y_n < y_n^0 + k_n \}$$

atrofida ( $h_i > 0, i = 1, 2, \dots, m, k_j > 0, j = 1, 2, \dots, n$ ) berilgan va ular quyidagi shartlarni bajarsin:

1)  $U_{hk}((x^0, y^0))$  da uzlusiz;

2)  $U_{hk}((x^0, y^0))$  da barcha xususiy hosilalarga ega va ular uzlusiz;

3) xususiy hosilalarning  $(x^0, y^0)$  nuqtadagi qiymatlaridan tuzilgan ushbu determinant noldan farqli;

$$\begin{vmatrix} \frac{\partial F_1}{\partial y_1}, \frac{\partial F_1}{\partial y_2}, \dots, \frac{\partial F_1}{\partial y_n} \\ \frac{\partial F_2}{\partial y_1}, \frac{\partial F_2}{\partial y_2}, \dots, \frac{\partial F_2}{\partial y_n} \\ \vdots \\ \frac{\partial F_n}{\partial y_1}, \frac{\partial F_n}{\partial y_2}, \dots, \frac{\partial F_n}{\partial y_n} \end{vmatrix} \neq 0$$

4)  $(x^0, y^0) = (x_1^0, x_2^0, \dots, x_m^0, y_1^0, y_2^0, \dots, y_n^0)$  nuqtada  $F_1(x^0, y^0) = 0$ ,  $F_2(x^0, y^0) = 0$ , ...,  $F_n(x^0, y^0) = 0$ . U holda  $(x^0, y^0)$  nuqtaning shunday  $U_{\delta_1}(x^0, y^0) = U_{\delta_2}(x^0, y^0) = \dots = U_{\delta_m}(x^0, y^0)$  atrofi ( $0 < \delta_1 < h_1$ ,  $0 < \delta_2 < h_2$ , ...,  $0 < \delta_m < h_m$ ,  $0 < \varepsilon_1 < k_1$ ,  $0 < \varepsilon_2 < k_2$ , ...,  $0 < \varepsilon_m < k_m$ ) topiladiki, bu atrofda

1<sup>l</sup>) (13.48) sistema oshkormas ko'rinishdagi funksiyalar sistemasini aniqlaydi. Ulami

$$y_1 = f_1(x_1, x_2, \dots, x_m), \quad y_2 = f_2(x_1, x_2, \dots, x_m), \quad \dots, \quad y_n = f_n(x_1, x_2, \dots, x_m)$$

deylik;

$$2^l) (x_1, x_2, \dots, x_m) = (x_1^0, x_2^0, \dots, x_m^0) \text{ da}$$

$$f_1(x_1^0, x_2^0, \dots, x_m^0) = y_1^0,$$

$$f_2(x_1^0, x_2^0, \dots, x_m^0) = y_2^0,$$

$$\dots \dots \dots$$

$$f_n(x_1^0, x_2^0, \dots, x_m^0) = y_n^0.$$

bo'ladi;

3<sup>l</sup>) oshkormas ko'rinishdagi aniqlangan  $f_1, f_2, \dots, f_n$  funksiyalar

$$\{(x_1, x_2, \dots, x_m) \in R^m : x_1^0 - \delta_1 < x_1 < x_1^0 + \delta_1, \quad x_2^0 - \delta_2 < x_2 < x_2^0 + \delta_2, \dots, \\ x_m^0 - \delta_m < x_m < x_m^0 + \delta_m\}$$

to'plamda uzlusiz va uzlusiz xususiy hosilalarga ega bo'ladi.

### Mashqlar

13.15. Agar  $\Delta x_1 \rightarrow 0$ ,  $\Delta x_2 \rightarrow 0$ , ...,  $\Delta x_m \rightarrow 0$  da  $a_1 \rightarrow 0$ ,  $a_2 \rightarrow 0$ , ...,  $a_m \rightarrow 0$  bo'lisa,  $a_1 \Delta x_1 + a_2 \Delta x_2 + \dots + a_m \Delta x_m = o(\rho)$  bo'lish ko'rsatilsin, bunda

$$\rho = \sqrt{\Delta x_1^2 + \Delta x_2^2 + \dots + \Delta x_m^2}.$$

13.16. Ushbu

$$f(x, y) = \sqrt[3]{x^3 + y^3}$$

funksiyaning  $(0, 0)$  nuqtada differensiallanuvchi emasligi isbotlansin.

13.17. Funksiya orttirmasini uning differensiali orqali taqribiy ifodalab, ushbu  $\alpha = \sqrt{1.02^3 + 1.97^3}$  miqdor taqribiy hisoblansin.

- 13.18. Ushbu  $u = \sqrt{xy + \frac{x}{y}}$  funksiya quyidagi  $u \left( x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} \right) = xy$  tenglamani qanoatlantirishi ko'rsatilgan.
- 13.19. Ma'lum perimetrga ega bo'lgan uchburchaklar orasida yuzasi eng kattasi teng tomonli uchburchak ekanligi isbotlansin.
- 13.20. Ushbu  $ye^x - x \ln y - 1 = 0$  tenglama  $(0, 1)$  nuqtaning atrofida uzluksiz oshkormas funksiyani aniqlashi ko'rsatilsin, uning hosilasi topilsin.

### Funksional ketma-ketliklar va qatorlar

#### 1-§. Funksional ketma-ketliklar

*1<sup>o</sup>. Funksional ketma-ketlik tushunchasi.* Aytaylik, har bir natural  $n$  ( $n \in N$ ) songa  $X \subset R$  to'plamda aniqlangan bitta  $f_n(x)$  funksiyani mos qo'yadigan qoida berilgan bo'lsin. Bu qoidaga ko'ra

$$f_1(x) f_2(x) \dots f_n(x) \quad (14.1)$$

to'plam hosil bo'ladi. Odatda (14.1) ni funksional ketma-ketlik (funksiyalar ketma-ketligi) deyiladi va uni umumiy had  $f_n(x)$  orqali  $\{f_n(x)\}$  yoki  $f_n(x)$  kabi belgilanadi.

Masalan, 1) har bir  $n$  ( $n \in N$ ) songa  $\frac{1}{n^2 + x^2}$  funksiyani mos qo'yuvchi qoida ushbu

$$\frac{1}{1+x^2}, \frac{1}{4+x^2}, \frac{1}{9+x^2}, \dots, \frac{1}{n^2+x^2}, \dots$$

funksional ketma-ketlikni hosil qiladi.

2) har bir  $n$  ( $n \in N$ ) songa  $\sin \frac{\sqrt{x}}{n}$  funksiyani mos qo'yish bilan quyidagi

$$\sin \frac{\sqrt{x}}{1}, \sin \frac{\sqrt{x}}{2}, \sin \frac{\sqrt{x}}{3}, \dots, \sin \frac{\sqrt{x}}{n}, \dots$$

funksional ketma-ketlikka ega bo'lamiz.

Faraz qilaylik,  $\{f_n(x)\}$ :

$$f_1(x), f_2(x), \dots, f_n(x), \dots$$

funksional ketma-ketlik  $X \subset R$  to'plamda berilgan (ketma-ketlikning har bir hadi  $X$  to'plamda aniqlangan) bo'lib,  $x_0 \in X$  bo'lsin.

*I-ta'rif.* Agar  $\{f_n(x_0)\}$ :

$$f_1(x_0), f_2(x_0), \dots, f_n(x_0), \dots$$

sonlar ketma-ketligi yaqinlashuvchi (uzoqlashuvchi) bo'lsa,  $\{f_n(x)\}$  funksional ketma-ketlik  $x_0$  nuqtada yaqinlashuvchi (uzoqlashuvchi) deyiladi,  $x_0$  nuqta esa  $\{f_n(x)\}$  ning yaqinlashish (uzoqlashish) nuqtasi deyiladi

$\{f_n(x)\}$  funksional ketma-ketlikning barcha yaqinlashish nuqtalaridan iborat to'plam funksional ketma-ketlikning yaqinlashish sohasi deyiladi.

Masalan,

$$f_n(x) = \frac{1}{n^2 + x^2} \quad (n = 1, 2, 3, \dots)$$

funksional ketma-ketlik  $\forall x_0 \in R$  da yaqinlashuvchi, binobarin, uning yaqinlashish sohasi  $R$  bo'ladi. Ushbu

$$f_n(x) = n^2 x + 1 \quad (n = 1, 2, 3, \dots)$$

funksional ketma-ketlik saqat  $x = 0$  nuqtada yaqinlashuvchi bo'ladi. Uning yaqinlashish sohasi bitta nuqtadan iborat to'plam bo'ladi.

Aytaylik,  $M$  to'plam ( $M \subset R$ )  $\{f_n(x)\}$  funksional ketma-ketlikning yaqinlashish sohasi bo'lsin. Unda  $\forall x \in M$  uchun

$$f_1(x), f_2(x), \dots, f_n(x),$$

ketma-ketlik chekli limitga ega bo'ladi.

**2-ta'rif.** Ushbu

$$f : x \rightarrow \lim_{n \rightarrow \infty} f_n(x) \quad (x \in M)$$

funksiya  $\{f_n(x)\}$  funksional ketma-ketlikning limit funksiyasi deyiladi. Demak,

$$\lim_{n \rightarrow \infty} f_n(x) = f(x) \quad (x \in M).$$

**1-misol.** Ushbu

$$f_n(x) = x^n \quad (n = 1, 2, 3, \dots)$$

funksional ketma-ketlikning yaqinlashish sohasi hamda limit funksiyasi topilsin.

◀ Bu funksional ketma-ketlik uchun:

$\forall x \in (1, +\infty)$  da

$$\lim_{n \rightarrow \infty} f_n(x) = \lim_{n \rightarrow \infty} x^n = \infty,$$

$x = 1$  bo'lganda

$$\lim_{n \rightarrow \infty} f_n(1) = 1,$$

$\forall x \in (-1, 1)$  da

$$\lim_{n \rightarrow \infty} f_n(x) = \lim_{n \rightarrow \infty} x^n = 0,$$

$\forall x \in (-\infty, -1]$  da ketma-ketlikning limiti mavjud bo'lmaydi.

Shunday qilib, berilgan funksional ketma-ketlikning yaqinlashish sohasi  $M = (-1, 1)$  bo'lib, limit funksiyasi

$$f(x) = \begin{cases} 0, & \text{agar } -1 < x < 1, \\ 1, & \text{agar } x = 1 \end{cases}$$

bo'ladi. ▶

**2°. Funksional ketma-ketlikning tekis yaqinlashuvchiligi.** Aytaylik,  $\{f_n(x)\}$ :

$$f_1(x), f_2(x), \dots, f_n(x), \dots$$

funksional ketma-ketlikning yaqinlashish sohasi  $M$  bo'lib, limit funksiyasi  $f(x)$  bo'lsin. Unda har bir  $x_0 \in M$  nuqtada

$$\lim_{n \rightarrow \infty} f_n(x_0) = f(x_0)$$

ya'ni

$$\forall \varepsilon > 0, \exists n_0 \in N, \forall n > n_0 : |f_n(x_0) - f(x_0)| < \varepsilon$$

bo'ladi. Bunda  $n_0$  natural son  $\varepsilon > 0$  songa va olingan  $x_0$  nuqtaga bog'liq bo'ladi:

$$n_0 = n_0(\varepsilon, x_0).$$

**3-ta'rif.** Agar  $\forall \varepsilon > 0$  olinganda ham shunday  $n_0 \in N$  topilsaki,  $\forall n > n_0$  va  $\forall x \in M$  uchun

$$|f_n(x) - f(x)| < \varepsilon$$

tengsizlik bajarilsa, ya'nı

$$\forall \varepsilon > 0, \exists n_0 \in N, \forall n > n_0, \forall x \in M \quad |f_n(x) - f(x)| < \varepsilon$$

bo'lsa,  $\{f_n(x)\}$  funksional ketma-ketlik  $M$  to'plamda  $f(x)$  ga tekis yaqinlashadi (funksional ketma-ketlik tekis yaqinlashuvchi) deyiladi. Uni

$$f_n(x) \xrightarrow{n \rightarrow \infty} f(x) \quad x \in M$$

kabi belgilanadi.

Bu holda ta'rifdagи  $n_0$  natural son faqat  $\varepsilon > 0$  ga bog'liq bo'ladi

$$n_0 = n_0(\varepsilon).$$

**4-ta'rif.** Agar

$$\forall n \in N, \exists \varepsilon_0 > 0, \exists x_0 \in M \quad |f_n(x_0) - f(x_0)| \geq \varepsilon$$

bo'lsa,  $\{f_n(x)\}$  funksional ketma-ketlik  $M$  to'plamda  $f(x)$  ga tekis yaqinlashmaydi (notekis yaqinlashadi) deyiladi.

**14.2-misol.** Ushbu

$$f_n(x) = \frac{\sin nx}{n} \quad (n = 1, 2, 3, \dots)$$

funksional ketma-ketlikning limit funksiyasi topilsin va unga tekis yaqinlashishi ko'rsatilsin.

◀ Ravshanki,

$$\lim_{n \rightarrow \infty} f_n(x) = \lim_{n \rightarrow \infty} \frac{\sin nx}{n} = 0.$$

Demak, limit funksiya  $f(x) = 0$  bo'ladi.

Agar  $\forall \varepsilon > 0$  son olinganda ham  $n_0 = \left\lceil \frac{1}{\varepsilon} \right\rceil$  deyilsa,  $([a] - a)$  sonining butun qismi)  $\forall n > n_0$  va  $\forall x \in M = (-\infty, +\infty)$  uchun

$$|f_n(x) - f(x)| = \left| \frac{\sin nx}{n} - 0 \right| \leq \frac{1}{n} < \frac{1}{n_0 + 1} < \varepsilon$$

bo'lganligi sababli

$$\frac{\sin nx}{n} \xrightarrow{n \rightarrow \infty} 0$$

bo'ladi. ▶

**14.3-misol.** Ushbu

$$f_n(x) = \frac{nx}{1 + n^2 x^2} \quad (n = 1, 2, 3, \dots)$$

funksional ketma-ketlikni  $[0, 1]$  oraliqda tekis yaqinlashishga tekshirilsin.

◀ Berilgan ketma-ketlikning limit funksiyasi

$$f(x) = \lim_{n \rightarrow \infty} f_n(x) = \lim_{n \rightarrow \infty} \frac{nx}{1 + n^2 x^2} = 0$$

bo'ladi. Bu esa ta'rifga ko'ra quyidagini bildiradi:  $\forall \varepsilon > 0$  olinganda ham,

$$n_0 = n_0(\varepsilon, x) = \begin{cases} 1 \\ \frac{1}{\varepsilon x} \end{cases} \quad (x \neq 0)$$

deyilsa,  $([a]-a)$ -sonining butun qismi  $\forall n > n_0$  uchun

$$|f_n(x) - f(x)| = \left| \frac{nx}{1+n^2x^2} - c \right| = \frac{nx}{1+n^2x^2} < \frac{1}{nx} \leq \frac{1}{(n_0+1)x} < \varepsilon$$

bo'ladi. Ravshanki,  $x = 0$  bo'lsa,  $\forall n \in N$  uchun

$$f_n(0) = f(0) = 0.$$

Biroq,  $\forall n \in N$ ,  $\varepsilon_0 = \frac{1}{4}$ ,  $x = \frac{1}{n}$  uchun

$$\left| f_n\left(\frac{1}{n}\right) - f\left(\frac{1}{n}\right) \right| = \frac{1}{1 + \frac{1}{n^2}} = \frac{1}{2} > \varepsilon$$

bo'ladi.

Demak, berilgan funksional ketma-ketlik  $[0, 1]$  da limit funksiyaga tekis yaqinlashmaydi. ►

**I-teorema.**  $\{f_n(x)\}$  funksional ketma-ketlikning  $M$  to'plamda  $f(x)$  ga tekis yaqinlashishi uchun

$$\limsup_{n \rightarrow \infty} |f_n(x) - f(x)| = 0$$

bo'lishi zarur va yetarli.

◀ **Zarurligi.**  $M$  to'plamda  $\{f_n(x)\}$  funksional ketma-ketlik  $f(x)$  limit funksiyaga tekis yaqinlashsin. Ta'rifga ko'ra  $\forall \varepsilon > 0$  olinganda ham shunday  $n_0 \in N$  topiladiki,  $n > n_0$  bo'lganda  $M$  to'plamning barcha  $x$  nuqtalari uchun

$$|f_n(x) - f(x)| < \varepsilon$$

bo'ladi. Bundan esa  $\forall n > n_0$  uchun

$$M_n = \sup_{x \in M} |f_n(x) - f(x)| \leq \varepsilon$$

bo'lishi kelib chiqadi. Demak,

$$\lim_{n \rightarrow \infty} M_n = \limsup_{n \rightarrow \infty} |f_n(x) - f(x)| = 0.$$

**Yetarlilikligi.**  $M$  to'plamda  $\{f_n(x)\}$  funksional ketma-ketlik  $f(x)$  limit funksiyaga ega bo'lib,

$$\limsup_{n \rightarrow \infty} |f_n(x) - f(x)| = 0$$

bo'lsin. Demak,  $\forall \varepsilon > 0$  olinganda ham shunday  $n_0 \in N$  topiladiki, barcha  $n > n_0$  uchun

$$\sup_{x \in M} |f_n(x) - f(x)| < \varepsilon$$

bo'ladi. Agar ushbu

$$|f_n(x) - f(x)| \leq \sup_{x \in M} |f_n(x) - f(x)|$$

munosabatni etiborga olsak, u holda  $\forall x \in M$  uchun

$$|f_n(x) - f(x)| < \epsilon$$

bo'tishini topamiz. Bu esa  $M$  to'plamda  $\{f_n(x)\}$  funksional ketma-ketlik  $f(x)$  limit funksiyaga tekis yaqinlashishini bilditadi. ►

**14.4-misol.** Ushbu

$$\{f_n(x)\} = \left\{ e^{-(x-n)^2} \right\}$$

funksional ketma-ketlikni  $-c < x < c$  ( $c > 0$ ) intervalda tekis yaqinlashuvchiligi ko'rsatilsin.

◀ Bu funksional ketma-ketlikning limit funksiyasi

$$f(x) = \lim_{n \rightarrow \infty} f_n(x) = \lim_{n \rightarrow \infty} e^{-(x-n)^2} = 0$$

bo'ladi. Natijada

$$M_n = \sup_{-c < x < c} |f_n(x) - f(x)| = \sup_{-c < x < c} (e^{-(x-n)^2} - 0) = \sup_{-c < x < c} e^{-(x-n)^2} = e^{(c-n)^2}$$

bo'llib, undan

$$\lim_{n \rightarrow \infty} M_n = \lim_{n \rightarrow \infty} e^{(c-n)^2} = 0$$

bo'tishini topamiz.

Demak, berilgan funksional ketma-ketlik  $(-c, c)$  oraliqda  $f(x) = 0$  limit funksiyaga tekis yaqinlashadi:

$$e^{-(x-n)^2} \xrightarrow{n \rightarrow \infty} 0 \quad (-c < x < c; \quad c > 0). \blacktriangleright$$

**14.5-misol.** Quyidagi

$$\{f_n(x)\} = \left\{ n \left( \sqrt{x + \frac{1}{n}} - \sqrt{x} \right) \right\} \quad (0 < x < +\infty)$$

funksional ketma-ketlik tekis yaqinlashuvchilikka tekshirilsin.

◀ Bu funksional ketma-ketlikning limit funksiyasini topamiz:

$$\lim_{n \rightarrow \infty} f_n(x) = \lim_{n \rightarrow \infty} n \left( \sqrt{x + \frac{1}{n}} - \sqrt{x} \right) = \lim_{n \rightarrow \infty} \frac{1}{\sqrt{x + \frac{1}{n}} + \sqrt{x}} = \frac{1}{2\sqrt{x}} \quad (0 < x < +\infty).$$

Demak,  $f(x) = \frac{1}{2\sqrt{x}}$ . Bu holda

$$\begin{aligned} M_n &= \sup_{0 < x < \infty} |f_n(x) - f(x)| = \sup_{0 < x < \infty} \left| n \left( \sqrt{x + \frac{1}{n}} - \sqrt{x} \right) - \frac{1}{2\sqrt{x}} \right| = \sup_{0 < x < \infty} \left| \frac{1}{\sqrt{x + \frac{1}{n}} + \sqrt{x}} - \frac{1}{2\sqrt{x}} \right| \\ &= \sup_{0 < x < \infty} \frac{\sqrt{x + \frac{1}{n}} - \sqrt{x}}{2\sqrt{x} \left( \sqrt{x + \frac{1}{n}} + \sqrt{x} \right)} = \sup_{0 < x < \infty} \frac{1}{2n\sqrt{x} \left( \sqrt{x + \frac{1}{n}} + \sqrt{x} \right)} \xrightarrow{n \rightarrow \infty} 0 \end{aligned}$$

bo'lib, berilgan funksional ketma-ketlik uchun 1-teoremaning sharti bajarilmaydi. Demak, qaralayotgan funksional ketma-ketlik teorisiga yaqinlashuvchi emas. ►

$X \subset R$  to'plamda  $\{f_n(x)\}$ :

$$f_1(x), f_2(x), \dots, f_n(x).$$

funktional ketma-ketlik berilgan bo'lsin.

**S-ta'rif.** Agar  $\forall \varepsilon > 0$  son olinganda ham shunday  $n_0 \in N$  son mavjud bo'lsaki,  $n > n_0$ ,  $m > n_0$  bo'lganda  $\forall x \in X$  nuqtalar uchun bir yo'la

$$|f_n(x) - f_m(x)| < \varepsilon$$

tengsizlik bajarilsa,  $\{f_n(x)\}$  funktional ketma-ketlik  $X$  to'plamda fundamental ketma-ketlik deb ataladi.

**2-teorema. (Koshi teoremasi).**  $\{f_n(x)\}$  funktional ketma-ketlik  $X$  to'plamda limit funksiyaga ega bo'lishi va unga tekis yaqinlashishi uchun u  $X$  to'plamda fundamental bo'lishi zarur va yetarli.

◀ **Zarurligi.**  $X$  to'plamda  $\{f_n(x)\}$  ketma-ketlik limit funksiyaga ega bo'lib, unga tekis yaqinlashsin:

$$f_n(x) \xrightarrow{\rightarrow} f(x) \quad (x \in X).$$

Tekis yaqinlishish ta'rifiga muvofiq  $\forall \varepsilon > 0$  son olinganda ham,  $\frac{\varepsilon}{2}$  ga ko'ra shunday  $n_0 \in N$  topiladiki,  $n > n_0$  bo'lganda  $\forall x \in X$  nuqtalar uchun

$$|f_n(x) - f(x)| < \frac{\varepsilon}{2}.$$

shuningdek,  $m > n_0$  bo'lganda  $\forall x \in X$  uchun

$$|f_m(x) - f(x)| < \frac{\varepsilon}{2}$$

bo'ladi. U holda  $n > n_0$ ,  $m > n_0$  va  $\forall x \in X$  uchun

$$|f_n(x) - f_m(x)| \leq |f_n(x) - f(x)| + |f_m(x) - f(x)| < \varepsilon$$

bo'ladi.

**Yetarlitigi.**  $\{f_n(x)\}$  ketma-ketlik  $X$  to'plamda fundamental ketma-ketlik bo'lsin:

$$\forall \varepsilon > 0, \exists n_0 \in N, n > n_0, m > n_0, \forall x \in X: |f_n(x) - f_m(x)| < \varepsilon \quad (14.2)$$

$X$  to'plamdan olingan har bir  $x_0$  da  $\{f_n(x)\}$  funktional ketma-ketlik  $\{f_n(x_0)\}$  sonlar ketma-ketligiga aylanadi. Ravshanki,  $\{f_n(x_0)\}$  ketma-ketlik fundamental ketma-ketlik bo'ladi.

U holda Koshi teoremasiga asosan (1-qism, 4-bob, 3-\$) \{f\_n(x\_0)\} yaqinlashuvchi. Demak,  $X$  to'plamning har bir  $x_0$  nuqtasida  $\{f_n(x_0)\}$  ketma-ketlik yaqinlashuvchi. Binobarin, funktional ketma-ketlik limit funksiyaga ega. Bu  $\{f_n(x)\}$  ketma-ketlikning limit funksiyasi  $f(x)$  deylik:

$$\lim_{n \rightarrow \infty} f_n(x) = f(x) \quad (x \in X).$$

Endi (14.2) tengsizlikda  $m \rightarrow \infty$  da (bunda  $n$  va  $x$  larni tayinlab) limitga o'tib quyidagini topamiz:

$$|f_n(x) - f(x)| \leq \varepsilon.$$

Bundan esa  $\{f_n(x)\}$  funksional ketma-ketlikning  $f(x)$  limit funksiyaga tekis yaqinlashishi kelib chiqadi. ►

### 2-§. Funksional qatorlar

**1<sup>º</sup>. Funksional qator tushunchasi.** Faraz qilaylik,  $X \subset R$  to'plamda  $\{u_n(x)\}$ :  
 $u_1(x), u_2(x), \dots, u_n(x), \dots$

funksional ketma-ketlik berilgan bo'lsin.

**6-ta'rif.** Quyidagi

$$u_1(x) + u_2(x) + \dots + u_n(x) + \dots$$

ifoda funksional qator deyiladi.  $\sum_{n=1}^{\infty} u_n(x)$  kabi belgilanadi:

$$\sum_{n=1}^{\infty} u_n(x) = u_1(x) + u_2(x) + \dots + u_n(x) + \dots \quad (14.3)$$

Bunda  $u_1(x), u_2(x), \dots$  funksiyalar (14.3) funksional qatorning hadlari,  $u_n(x)$  esa umumiyl had deyiladi.

Masalan,

$$\sum_{n=1}^{\infty} x^{n-1} = 1 + x + x^2 + \dots + x^{n-1} + \dots,$$

$$\sum_{n=1}^{\infty} \frac{1}{(x+n)(x+n+1)} = \frac{1}{(x+1)(x+2)} + \frac{1}{(x+2)(x+3)} +$$

lar funksional qatorlar bo'ldi.

(14.3) funksional qatorning hadlaridan tuzilgan ushbu

$$S_1(x) = u_1(x),$$

$$S_2(x) = u_1(x) + u_2(x),$$

$$S_n(x) = u_1(x) + u_2(x) + \dots + u_n(x) + \dots$$

yig'indilar (14.3) funksional qatorning qismiy yig'indilari deyiladi.

Bu yig'indilar quyidagi

$$S_1(x), S_2(x), \dots, S_n(x),$$

funksional ketma-ketlikni hosil qiladi.

**7-ta'rif.** Agar  $\{S_n(x)\}$  funksional ketma-ketlik  $x_0 \in X$  nuqtada yaqinlashuvchi (uzoqlashuvchi) bo'lsa,  $\sum_{n=1}^{\infty} u_n(x)$  funksional qator  $x_0$  nuqtada yaqinlashuvchi (uzoqlashuvchi) deyiladi.

Bu  $\{S_n(x)\}$  funksional ketma-ketlikning yaqinlashish sohasi (to'plami) tegishli funksional qatorning yaqinlashish sohasi (to'plami) deyiladi.  $\{S_n(x)\}$  funksional ketma-ketlikning limit funksiyasi  $S(x)$ :

$$\lim_{n \rightarrow \infty} S_n(x) = S(x)$$

berilgan

$$\sum_{n=1}^{\infty} u_n(x) = u_1(x) + u_2(x) + \dots + u_n(x) + \dots$$

funksional qator yig'indisi deyiladi.

**14.6-misol.** Ushbu

$$\sum_{n=1}^{\infty} x^{n-1} = 1 + x + x^2 + \dots + x^{n-1} + \dots$$

funksional qatorning yaqinlashish sohasi hamda yig'indisi topilsin.

◀ Berilgan funksional qatorning qismiy yig'indisi

$$S_n(x) = 1 + x + x^2 + \dots + x^{n-1} = \begin{cases} \frac{1-x^n}{1-x}, & \text{agar } x \neq 1 \text{ bo'lsa,} \\ n, & \text{agar } x = 1 \text{ bo'lsa} \end{cases}$$

bo'ladi. Unda

$\forall x \in (-1, 1)$  da

$$\lim_{n \rightarrow \infty} S_n(x) = \lim_{n \rightarrow \infty} \frac{1-x^n}{1-x} = \frac{1}{1-x};$$

$\forall x \in [1, +\infty)$  da

$$\lim_{n \rightarrow \infty} S_n(x) = \infty;$$

$\forall x \in (-\infty, -1]$  da  $\{S_n(x)\}$  ketma-ketlik limitga ega emas. Demak, berilgan funksional qatorning yaqinlashish sohasi  $M = (-1, 1)$ , yig'indisi  $S(x) = \frac{1}{1-x}$  bo'ladi. ▶

**2°. Funksional qatorning tekis yaqinlashuvchiligi.** Ushbu

$$\sum_{n=1}^{\infty} u_n(x) = u_1(x) + u_2(x) + \dots + u_n(x) + \dots \quad (14.4)$$

funksional qator  $M$  to'plamda yaqinlashuvchi bo'lib, uning yig'indisi  $S(x)$  bo'lsin:

$$\lim_{n \rightarrow \infty} S_n(x) = \lim_{n \rightarrow \infty} [u_1(x) + u_2(x) + \dots + u_n(x)] = S(x).$$

**8-ta'rif.** Agar  $\sum_{n=1}^{\infty} u_n(x)$  funksional qatorning qismiy yig'indilaridan iborat  $\{S_n(x)\}$  funksional ketma-ketlik  $M$  to'plamda qator yig'indisi  $S(x)$  ga tekis yaqinlashsa, bu funksional qator  $M$  to'plamda tekis yaqinlashuvchi deb ataladi, aks holda, ya'ni  $\{S_n(x)\}$  funksional ketma-ketlik  $M$  to'plamda  $S(x)$  ga tekis yaqinlashmasa, (14.4) funksional qator  $M$  to'plamda  $S(x)$  ga tekis yaqinlashmaydi deyiladi.

**14.7-misol.** Ushbu

$$\sum_{n=1}^{\infty} \frac{1}{(x+n)(x+n+1)} \quad (0 < x < \infty)$$

funksional qatorni tekis yaqinlashishga tekshirilsin.

◀ Bu qatorning qismiy yig'indisi

$$S_n(x) = \frac{1}{(x+1)(x+2)} + \frac{1}{(x+2)(x+3)} + \dots + \frac{1}{(x+n)(x+n+1)} = \left( \frac{1}{x+1} - \frac{1}{x+2} \right) + \left( \frac{1}{x+2} - \frac{1}{x+3} \right) + \dots + \left( \frac{1}{x+n} - \frac{1}{x+n+1} \right) = \frac{1}{x+1} - \frac{1}{x+n+1}$$

bo'ladi.

Endi  $\forall \varepsilon > 0$  son olinganda  $n_0 = \left\lceil \frac{1}{\varepsilon} - (1+x) \right\rceil$  deyilsa, ( $[a] - a$  sonining butun qismi) barcha  $n > n_0$  uchun

$$|S_n(x) - S(x)| = \left| \frac{1}{x+1} - \frac{1}{x+n+1} - \frac{1}{x+1} \right| = \frac{1}{x+n+1} < \frac{1}{x+n_0+2} < \varepsilon \quad (14.5)$$

bo'ladi. Bundagi  $n_0$  natural son  $\varepsilon > 0$  ga hamda  $x$  ( $0 \leq x < \infty$ ) nuqtalarga bog'liq. Biroq  $n'_0$  deb

$$n'_0 = \max_{0 \leq x < \infty} \left[ \frac{1}{\varepsilon} - (1+x) \right] - \left[ \frac{1}{\varepsilon} - 1 \right]$$

ni olinsa, unda  $n > n'_0$  bo'lgan  $n$  larda yuqoridaq: (14.5) tengsizlit bajarilaveradi.

Demak, berilgan funksional qator uchun ta'rifdag'i  $n_0$  natural son barcha  $x$  ( $0 \leq x < \infty$ ) nuqtalari uchun umumiy bo'ladi, ya'ni  $x$  ga bog'liq bo'lmaydi. Demak, berilgan funksional qator tekis yaqinlashuvchi. ▶

**14.8-misol** Quyidagi

$$\sum_{n=1}^{\infty} \frac{x}{((n-1)x+1)(nx+1)} \quad (0 < x < \infty)$$

funksional qatorni tekis yaqinlashishga tekshirilsin.

◀ Bu funksional qatorning qismiy yig'indisi

$$S_n(x) = \frac{x}{1(x+1)} + \frac{x}{(x+1)(2x+1)} + \dots + \frac{x}{((n-1)x+1)(nx+1)} = \left( 1 - \frac{1}{x+1} \right) + \left( \frac{1}{x+1} - \frac{1}{2x+1} \right) + \dots + \left( \frac{1}{(n-1)x+1} - \frac{1}{nx+1} \right) = 1 - \frac{1}{nx+1}$$

bo'lib, uning yig'indisi

$$S(x) - \lim_{n \rightarrow \infty} S_n(x) = \lim_{n \rightarrow \infty} \left( 1 - \frac{1}{nx+1} \right) = 1 \quad (0 < x < \infty)$$

bo'ladi.

Endi  $\forall \varepsilon > 0$  son olinganda  $n_0 = \left\lceil \frac{1}{\varepsilon} \left( \frac{1}{x} - 1 \right) \right\rceil$  ( $x \neq 0$ ) deyilsa, ( $[a] - a$  sonining butun qismi) barcha  $n > n_0$  uchun

$$|S_n(x) - S(x)| = \left| 1 - \frac{1}{nx+1} \right| = \frac{1}{nx+1} \leq \frac{1}{(n_0+1)x+1} < \varepsilon$$

bo'ladi. (Agar  $x = 0$  bo'lsa, ravshanki,  $\forall n$  uchun  $S_n(0) = S(0) = 1$  bo'lib,  
 $S_n(0) - S(0) = 0$ )

bo'ladi.) Bundagi  $n_0$  natural son  $\varepsilon > 0$  va  $x$  ( $0 \leq x < \infty$ ) nuqtalarga bog'liq bo'lib, u barcha  $x$  ( $0 \leq x < \infty$ ) nuqtalari uchun umumiy bo'la olmaydi (bu holda  $n_0 = \left\lceil \frac{1}{x \cdot \varepsilon} - 1 \right\rceil$  ning  $(0, +\infty)$  da  $x$  bo'yicha maksimumi chekli son emas.)

Boshqacha qilib aytganda, istalgan  $n$  natural son olsak ham shunday  $\varepsilon_0$  (masalan  $\varepsilon_0 = \frac{1}{n}$ ) va  $x = \frac{1}{n} \in (0, +\infty)$  nuqta topildiki,

$$\left| S_n\left(\frac{1}{n}\right) - S\left(\frac{1}{n}\right) \right| = \frac{1}{n \cdot \frac{1}{n} + 1} = \frac{1}{2} > \varepsilon_0$$

bo'ladi. Demak, berilgan funksional qator  $(0, +\infty)$  da tekis yaqinlashuvchi emas. ▶

**3-teorema.** Aytaylik.  $M \subset R$  to'plamda  $\sum_{n=1}^{\infty} u_n(x)$  funksional qator berilgan bo'lib, uning yig'indisi  $S(x)$  bo'lsin. Bu funksional qatorning  $M$  da tekis yaqinlashuvchi bo'lishi uchun, uning qismiy yig'indilari ketma-ketligi  $\{S_n(x)\}$  ning  $M$  da fundamental bo'lishi zarur va yetarli.

◀ Bu teorema funksional ketma-ketlikning tekis yaqinlashish haqidagi 2-teoremani funksional qatorga nisbatan ayttilishi bo'lib, uning isboti 2-teoremaning isboti kabitidir. ▶

Funksional qator

$$\sum_{n=1}^{\infty} u_n(x) = u_1(x) + u_2(x) + \dots + u_n(x) + \dots$$

ning tekis yaqinlashuvchi bo'lishi haqidagi 8-ta'rif hamda funksional ketma-ketlikning tekis yaqinlashuvchi bo'lishining zatur va yetarli shartini ifodalovchchi 1-teoremadan foydalanim quyidagi teoremagaga kelamiz.

**4-teorema.**  $\sum_{n=1}^{\infty} u_n(x)$  funksional qator  $M$  to'plamda  $S(x)$  ga tekis yaqinlashishi uchun

$$\lim_{n \rightarrow \infty} \sup_{x \in M} |S_n(x) - S(x)| = 0$$

bo'lishi zatur va yetarli, bunda  $S_n(x) = u_1(x) + u_2(x) + \dots + u_n(x)$

Masalan,

$$\sum_{n=1}^{\infty} x^{n-1} = 1 + x + x^2 + \dots + x^n + \dots \quad (x \in (-1, 1))$$

funksional qatorning qismiy yig'indisi  $S_n(x) = \frac{1-x^n}{1-x}$ , yig'indisi  $S(x) = \frac{1}{1-x}$  bo'lib,  $(-1, +1)$  da  $S_n(x)$  yig'indi  $S(x)$  ga tekis yaqinlashmaydi, chunki

$$|S_n(x) - S(x)| = \left| \frac{x^n}{1-x} \right| \quad (x \in (-1, +1))$$

bo'lib,

$$\sup_{x \in (-1, +1)} |S_n(x) - S(x)| = 0$$

bo'ladi.

**S-teorema. (Veyershtrass alomati).** Agar ushbu

$$\sum_{n=1}^{\infty} u_n(x) = u_1(x) + u_2(x) + \dots + u_n(x) + \dots$$

funksional qatorning har bir hadi  $M \subset R$  to'plamda quyidagi

$$|u_n(x)| \leq C_n \quad (n = 1, 2, 3, \dots) \quad (14.6)$$

tengsizlikni qanoatlantrisa va

$$\sum_{n=1}^{\infty} C_n = C_1 + C_2 + \dots + C_n + \dots \quad (14.7)$$

sonli qator yaqinlashuvchi bo'lsa, u holda funksional qator  $M$  to'plamda tekis yaqinlashuvchi bo'ladi.

◀ Modomiki, (14.7) qator yaqinlashuvchi ekan, 1-qism, 11-bob, 2-§ da keltirilgan teoremaga asosan,  $\forall \varepsilon > 0$  son olinganda ham, shunday  $n_0 \in N$  topiladiki, barcha  $n > n_0$ ,  $m > n$  uchun

$$C_{n+1} + C_{n+2} + \dots + C_m < \varepsilon$$

bo'ladi. (14.6) tengsizlikdan foydalanib  $M$  to'plamning barcha  $x$  nuqtalari uchun

$$|u_{n+1}(x) + u_{n+2}(x) + \dots + u_m(x)| < \varepsilon$$

bo'lishini topamiz. Demak,  $S_n(x) = u_1(x) + u_2(x) + \dots + u_n(x)$  ( $n = 1, 2, \dots$ ) dan tuzilgan  $\{S_n(x)\}$  funksional ketma-ketlik  $M$  da fundamental. Bundan esa 3-teoremaga ko'ra berilgan funksional qatorning  $M$  to'plamda tekis yaqinlashuvchi bo'lishi kelib chiqadi. ▶

**14.9-misol.** Ushbu

$$\sum_{n=1}^{\infty} u_n(x) = \sum_{n=1}^{\infty} -\frac{nx}{1+n^5 x^2} \quad (0 \leq x < \infty)$$

funksional qator tekis yaqinlashishga tekshirilsin.

◀ Berilgan funksional qatorning umumiy hadi

$$u_n(x) = \frac{nx}{1+n^5 x^2} \quad (n = 1, 2, 3, \dots)$$

funksiyadan iborat. Bu funksiyani  $[0, +\infty)$  oraliqda ekstremumiga tekshiramiz.

$u_n(x)$  funksiyaning hosilasi yagona  $x = n^{-\frac{5}{2}}$  nuqliada nolga aylanadi ( $x = n^{-\frac{5}{2}}$  stasionar nuqta). Stasionar nuqta

$$u_n''(n^{-\frac{5}{2}}) < 0$$

bo'ladi. Demak,  $u_n(x)$  funksiya  $x = n^{-\frac{5}{2}} \in [0, +\infty)$  nuqtada maksimumga erishadi.

Uning maksimum qiymati esa  $\frac{1}{2} n^{\frac{3}{2}}$  ga teng. Demak,  $0 \leq x < \infty$  da

$$|u_n(x)| = \left| \frac{nx}{1+n^3x^2} \right| \leq \frac{1}{2n^{\frac{3}{2}}}$$

bo'ladi. Agar  $\sum_{n=1}^{\infty} \frac{1}{2n^{\frac{3}{2}}}$  qatorning yaqinlashuvchiligini etiborga olsak, unda Veyershtrass alomatiga ko'ra, berilgan funksional qatorning  $[0, +\infty)$  da tekis yaqinlashuvchi ekanligini topamiz. ▶

### 3-§. Tekis yaqinlashuvchi funksional ketma-ketlik va qatorning xossalari

*1°. Funksional qator yig'indisining uzuksizligi.*  $M \subset R$  to'plamda biror yaqinlashuvchi

$$\sum_{n=1}^{\infty} u_n(x) = u_1(x) + u_2(x) + \dots + u_n(x) + \dots$$

funksional qator berilgan bo'lib, uning yig'indisi  $S(x)$  bo'lsin.

**6-teorema.** Agar  $\sum_{n=1}^{\infty} u_n(x)$  funksional qatorning har bir hadi  $u_n(x)$  ( $n = 1, 2, 3, \dots$ )  $M$  to'plamda uzuksiz bo'lib, bu funksional qator  $M$  da tekis yaqinlashuvchi bo'lsa, u holda qatorning yig'indisi  $S(x)$  ham  $M$  to'plamda uzuksiz bo'ladi.

◀  $\forall x_0 \in M$  bo'lsin. Funksional qator tekis yaqinlashuvchi. Ta'rifga ko'ra.  $\forall \varepsilon > 0$  olinganda ham shunday  $n_0 \in N$  topiladiki,  $\forall n > n_0$  va  $M$  to'plamning barcha  $x$  nuqtalari uchun bir yo'la

$$|S_n(x) - S(x)| < \frac{\varepsilon}{3} \quad (14.8)$$

jumladan

$$|S_n(x_0) - S(x_0)| < \frac{\varepsilon}{3} \quad (14.9)$$

tengsizlik bajariladi.

Modomiki, funksional qatorning har bir hadi  $M$  to'plamda uzuksiz ekan, unda

$$S_n(x) = u_1(x) + u_2(x) + \dots + u_n(x)$$

funksiya ham  $M$  da, jumladan  $x_0$  nuqtada uzuksiz bo'ladi. Demak, yuqorida  $\varepsilon > 0$  olinganda ham,  $\frac{\varepsilon}{3}$  ga ko'ra shunday  $\delta > 0$  topiladiki,  $|x - x_0| < \delta$  ho'lganda

$$|S_n(x) - S(x_0)| < \frac{\varepsilon}{3} \quad (14.10)$$

bo'ladi.

YUqorida (14.8), (14.9) hamda (14.10) tengsizliklardan foydalaniib topamiz:

$$|S(x) - S(x_0)| \leq |S(x) - S_n(x)| + |S_n(x) - S_n(x_0)| +$$

$$+ |S_n(x_0) - S(x_0)| < \frac{\varepsilon}{3} + \frac{\varepsilon}{3} + \frac{\varepsilon}{3} = \varepsilon$$

Demak,  $\forall \varepsilon > 0$  olinganda ham, shunday  $\delta > 0$  topiladiki  $|x - x_0| < \delta$  bo'lganda

$$|S(x) - S(x_0)| < \varepsilon$$

bo'ladi. Bu esa  $S(x)$  funksiyaning  $\forall x_0 \in M$  nuqtada uzuksiz ekanligini bildiradi. ▶

Bu teoremaning shartlari bajarilganda ushbu

$$S(x_0) = \lim_{\epsilon \rightarrow x_0} \left[ \lim_{n \rightarrow \infty} S_n(x) \right] = \lim_{n \rightarrow \infty} \left[ \lim_{x \rightarrow x_0} S_n(x) \right]$$

munosabat o'rinni bo'ladi.

**2<sup>o</sup>. Funktsional ketma-ketlik limit funksiyasining uzuksizligi.**  $M \subset R$  to'plamda  $\{f_n(x)\}$ :

$$f_1(x), f_2(x), \dots, f_n(x).$$

funksional ketma-ketlik berilgan bo'lib, uning limit funksiyasi  $f(x)$  bo'lsin:

$$\lim_{n \rightarrow \infty} f_n(x) = f(x).$$

**7-teorema.** Agar  $\{f_n(x)\}$  funksional ketma-ketlikning har bir  $f_n(x)$  ( $n = 1, 2, \dots$ ) hadi  $M$  to'plamda uzuksiz bo'lib, bu funksional ketma-ketlik  $M$  to'plamda tekis yaqinlashuvchi bo'lsa, u holda  $f(x)$  limit funksiya ham  $M$  to'plamda uzuksiz bo'ladi.

Bu teoremaning shartlari bajarilganda ushbu

$$f(x) = \lim_{\epsilon \rightarrow x} \left[ \lim_{n \rightarrow \infty} f_n(\epsilon) \right] = \lim_{n \rightarrow \infty} \left[ \lim_{\epsilon \rightarrow x} f_n(\epsilon) \right]$$

munosabat o'rinni bo'ladi.

**3<sup>o</sup>. Funktsional qatorlarda hadma-had limitga o'tish.**  $M \subset R$  to'plamda yaqinlashuvchi

$$\sum_{n=1}^{\infty} u_n(x) = u_1(x) + u_2(x) + \dots + u_n(x) + \dots \quad (14.11)$$

funksional qator berilgan bo'lib, uning yig'indisi  $S(x)$  bo'lsin.  $x_0$  nuqta esa  $M$  to'plamning limit nuqtasi.

**8-teorema.** Agar  $x \rightarrow x_0$  da  $\sum_{n=1}^{\infty} u_n(x)$  funksional qatorning har bir  $u_n(x)$  ( $n = 1, 2, \dots$ ) hadi chekli

$$\lim_{x \rightarrow x_0} u_n(x) = C_n \quad (n = 1, 2, 3, \dots) \quad (14.12)$$

limitga ega bo'lib, bu qator  $M$  da tekis yaqinlashuvchi bo'lsa, u holda

$$\sum_{n=1}^{\infty} C_n = C_1 + C_2 + \dots + C_n + \dots$$

qator yaqinlashuvchi, uning yig'indisi  $C$  esa  $S(x)$  ning  $x \rightarrow x_0$  dagi limiti

$$\lim_{x \rightarrow x_0} S(x) = C$$

ga teng bo'ldi.

◀ Shartga ko'ra (14.11) funksional qator tekis yaqinlashuvchi. U holda 3-teoremaga asosan,  $\forall \varepsilon > 0$  olinganda ham, shunday  $n_0 \in N$  topiladiki, barcha  $n > n_0$ ,  $m > n$  lar va  $M$  to'plamning barcha  $x$  nuqtalari uchun

$$|u_{n+1}(x) + u_{n+2}(x) + \dots + u_m(x)| < \varepsilon \quad (14.13)$$

tengsizlik bajariladi. (14.12) munosabatni etiborga olib, (14.13) tengsizlikda  $x \rightarrow x_0$  da limitga o'tib quyidagini topamiz:

$$|C_{n+1} + C_{n+2} + \dots + C_m| \leq \varepsilon$$

Demak,  $\forall \varepsilon > 0$  olinganda ham, shunday  $n_0 \in N$  topiladiki, barcha  $n > n_0$ ,  $m > n$  lar uchun

$$|C_{n+1} + C_{n+2} + \dots + C_m| \leq \varepsilon$$

tengsizlik bajarilar ekan. Qator yaqinlashuvchiligining zaruriy va yetarli shartini ifodalovchi teoremaga muvosiq (qaralsin, 1-qism, 2-bob. 3-§).

$$\sum_{n=1}^{\infty} C_n = C_1 + C_2 + \dots + C_n + \dots$$

qator yaqinlashuvchi bo'ldi. Demak,

$$\lim_{n \rightarrow \infty} C_n = C,$$

bunda

$$C_n = C_1 + C_2 + \dots + C_n.$$

Endi  $x \rightarrow x_0$  da (14.11) funksional qator yig'indisi  $S(x)$  ning limiti  $C$  ga teng, ya'ni

$$\lim_{n \rightarrow x_0} S(x) = C$$

bo'lishini ko'rsatamiz. Shu maqsadda ushbu

$$S(x) - C$$

ayirmani olib, uni quyidagicha yozamiz:

$$S(x) - C = [S(x) - S_n(x)] + [S_n(x) - C_n] + [C_n - C] \quad (14.14)$$

bunda

$$S_n(x) = u_1(x) + u_2(x) + \dots + u_n(x).$$

Teoremaning shartiga ko'ra (14.11) funksional qator tekis yaqinlashuvchi. Demak,  $\forall \varepsilon > 0$  olinganda ham,  $\frac{\varepsilon}{3}$  ga ko'ra shunday  $n_0 \in N$  topiladiki, barcha  $n > n_0$  va  $M$  to'plamning barcha  $x$  nuqtalari uchun

$$|S_n(x) - S(x)| < \frac{\varepsilon}{3} \quad (14.15)$$

tengsizlik bajariladi.

(14.12) munosabatdan foydalanib quyidagini topamiz:

$$\lim_{x \rightarrow x_0} S_n(x) = \lim_{x \rightarrow x_0} [u_1(x) + u_2(x) + \dots + u_n(x)] = C_1 + C_2 + \dots + C_n = C_n.$$

Demak,  $\forall \varepsilon > 0$  olinganda ham,  $\frac{\varepsilon}{3}$  ga ko'ra shunday  $\delta > 0$  topiladiki,  $|x - x_0| < \delta$  bo'lganda

$$|S_n(x) - C_n| < \frac{\varepsilon}{3} \quad (14.16)$$

tengsizlik bajariladi.

Yuqorida isbot etilganiga ko'ra

$$\lim_{n \rightarrow \infty} C_n = C.$$

Demak,  $\forall \varepsilon > 0$  olinganda ham,  $\frac{\varepsilon}{3}$  ga ko'ra shunday  $n_0 \in N$  topiladiki, barcha  $n > n_0'$  uchun

$$|C_n - C| < \frac{\varepsilon}{3} \quad (14.17)$$

bo'ladi. Shuni ham aytish kerakki, agar  $n_0 = \max\{n_0, n_0'\}$  deb olinsa, unda barcha  $n > n_0$  uchun (14.15) va (14.17) tengsizliklar bir vaqtida bajariladi.

Natijada (14.14) munosabatlardan, (14.15), (14.16) va (14.17) tengsizliklarni etiborga oлган holda, quyidagini topamiz:

$$|S(x) - C| \leq |S(x) - S_n(x)| + |S_n(x) - C_n| + |C_n - C| < \frac{\varepsilon}{3} + \frac{\varepsilon}{3} + \frac{\varepsilon}{3} < \varepsilon.$$

Demak,  $\forall \varepsilon > 0$  olinganda ham, shunday  $\delta > 0$  topiladiki,  $|x - x_0| < \delta$  uchun ( $x \in M$ )

$$|S(x) - C| < \varepsilon$$

tengsizlik bajariladi. Bu esa  $\lim_{x \rightarrow x_0} S(x) = C$  ekanini bildiradi. ▶

Yuqoridagi limit munosabatni quyidagicha ham yozish mumkin:

$$\lim_{x \rightarrow x_0} \sum_{n=1}^{\infty} u_n(x) = \sum_{n=1}^{\infty} \lim_{x \rightarrow x_0} u_n(x)$$

Bu esa 8-teoremaning shartlari bajarilganda cheksiz qatorlarda ham hadma-had limitga o'tish qoidasi o'rinni bo'lishini ko'rsatadi.

**4°. Funktsional ketma-ketliklarda hadma-had limitga o'tish.**  $M \subset R$  to'plamida  $\{f_n(x)\}$ :

$$f_1(x), f_2(x), \dots, f_n(x), \dots$$

funktsional ketma-ketlik berilgan bo'lib, uning limit funksiyasi  $f(x)$  bo'lsin.  $x_0$  nuqtada esa  $M$  to'plamning limit nuqtasi.

**9-teorema.** Agar  $x \rightarrow x_0$  da  $\{f_n(x)\}$  funktsional ketma-ketlikning har bir  $f_n(x)$  ( $n = 1, 2, \dots$ ) hadi chekli

$$\lim_{x \rightarrow x_0} f_n(x) = a_n \quad (n = 1, 2, 3, \dots)$$

limitga ega bo'lib, bu ketma-ketlik  $M$  da tekis yaqinlashuvchi bo'lsa, u holda  $\{a_n\}$ :

$$a_1, a_2, \dots, a_n.$$

ketma-ketlik ham yaqinlashuvchi, uning  $a = \lim_{n \rightarrow \infty} a_n$  limiti esa  $f(x)$  ning  $x \rightarrow x_0$  dagi limitga teng

$$\lim_{x \rightarrow x_0} f(x) = a$$

bo'ladi.

**5°. Funktsional qatorlarni hadma-had integrallash.**  $[a, b]$  segmentda yaqinlashuvchi

$$u_1(x) + u_2(x) + \dots + u_n(x) + \dots \quad (14.11)$$

funktional qator berilgan bo'lib, uning yig'indisi  $S(x)$  bo'lsin:

$$S(x) = \sum_{n=1}^{\infty} u_n(x).$$

**10-teorema.** Agar  $\sum_{n=1}^{\infty} u_n(x)$  qatorning har biri  $u_n(x)$  hadi ( $n = 1, 2, \dots$ )  $[a, b]$  segmentda uzlusiz bo'lib, bu qator shu segmentda tekis yaqinlashuvchi bo'lsa, u holda qator hadlarining integrallaridan tuzilgan

$$\int_a^b u_1(x) dx + \int_a^b u_2(x) dx + \dots + \int_a^b u_n(x) dx + \dots$$

qator ham yaqinlashuvchi bo'ladi, uning yig'indisi esa  $\int_a^b S(x) dx$  ga teng bo'ladi:

$$\sum_{n=1}^{\infty} \int_a^b u_n(x) dx = \int_a^b S(x) dx.$$

◀ Berilgan funktional qatorning har biri  $u_n(x)$  hadi ( $n = 1, 2, \dots$ )  $[a, b]$  da uzlusiz, demak,  $u_n(x)$  ( $n = 1, 2, \dots$ ) funksiyalar  $[a, b]$  segmentda integrallanuvchi. Shartga ko'ra funktional qator  $[a, b]$  segmentda tekis yaqinlashuvchi. Unda 6-teoremaga ko'ra, funktional qatorning yig'indisi  $S(x)$  funksiya  $[a, b]$  da uzlusiz, demak, integrallanuvchi bo'ladi.

Avvalo (14.11) funktional qator hadlarining integrallaridan tuzilgan

$$\sum_{n=1}^{\infty} \int_a^b u_n(x) dx = \int_a^b u_1(x) dx + \int_a^b u_2(x) dx + \dots + \int_a^b u_n(x) dx + \dots$$

qatorning yaqinlashuvchi bo'lishini ko'rsatamiz.

Shartga ko'ra (14.11) funktional qator  $[a, b]$  da tekis yaqinlashuvchi. U holda 3-teoremaga asosan,  $\forall \epsilon > 0$  olinganda ham,  $\frac{\epsilon}{b-a}$  ga ko'ra shunday  $n_0 \in N$  topiladiki,  $n > n_0$ ,  $m > n$  bo'lganda

$$|u_{n+1}(x) + u_{n+2}(x) + \dots + u_m(x)| < \frac{\epsilon}{b-a}$$

bo'ladi. Bu tengsizlikdan foydalab quyidagini topamiz:

$$\left| \int_a^b u_{n+1}(x)dx + \int_a^{n+2}(x)dx + \dots + \int_a^m(x)dx \right| \leq$$

$$\leq \int_a^m |u_{n+1}(x) + u_{n+2}(x) + \dots + u_m(x)|dx < \frac{\epsilon}{\epsilon - a} (\epsilon - a) = \epsilon.$$
(14.18)

Demak,  $\forall \epsilon > 0$  olinganda ham, shunday  $n_0 \in N$  topiladiki,  $n > n_0$ ,  $m > n$  bo'lganda (14.18) tengsizlik o'rini bo'ladi. 3-teoremaiga asosan

$$\sum_{n=1}^{\infty} \int_a^b u_n(x)dx$$

qator yaqinlashuvchi bo'ladi. Odatdagidek berilgan funksional qatorning qismiy yig'indisini  $S_n(x)$  deymiz. Funksional qatorning tekis yaqinlashuvchiligi ta'rifidan,  $\forall \epsilon > 0$  olinganda ham,  $\frac{\epsilon}{\epsilon - a}$  ga ko'ra shunday  $n_0 \in N$  topiladiki, barcha  $n > n_0$  va  $[a, \epsilon]$  segmentning barcha  $x$  nuqtalar uchun

$$|S_n(x) - S(x)| < \frac{\epsilon}{\epsilon - a}$$

bo'ladi.

Aniq integral xossalardan foydalanib quyidagiini topamiz:

$$\begin{aligned} \int_a^b S(x)dx &= \int_a^b S_n(x)dx + \int_a^b [S(x) - S_n(x)]dx = \int_a^b u_1(x)dx + \\ &+ \int_a^b u_2(x)dx + \dots + \int_a^b u_n(x)dx + \int_a^b [S(x) - S_n(x)]dx. \end{aligned}$$

Agar

$$\left| \int_a^b [S(x) - S_n(x)]dx \right| \leq \int_a^b |S(x) - S_n(x)|dx < \frac{\epsilon}{\epsilon - a} (\epsilon - a) = \epsilon$$

bo'lishini etiborga olsak, unda

$$\lim_{n \rightarrow \infty} \int_a^b [S(x) - S_n(x)]dx = 0$$

bo'lib, natija

$$\int_a^b S(x)dx = \int_a^b u_1(x)dx + \int_a^b u_2(x)dx + \dots + \int_a^b u_n(x)dx + \dots$$

ekanligi kelib chiqadi. ▶

Yuqoridaq munosabatni quyidagicha ham yozish mumkin:

$$\int_a^b \left( \sum_{n=1}^{\infty} u_n(x) \right) dx = \sum_{n=1}^{\infty} \int_a^b u_n(x)dx$$

Bu esa 10-teoremaning shartlari bajarilganda cheksiz qatorlarda ham hadmashad integrallash qoidasi o'rini bo'lishini ko'rsatadi.

*6<sup>o</sup>. Funksional ketma-ketliklarni hadma-had integrallash.*  $[a, b]$  segmentda  $\{f_n(x)\}$ :

$$f_1(x), f_2(x), \dots, f_n(x), \dots$$

funksional ketma-ketlik berilgan bo'lib, uning limit funksiyasi  $f(x)$  bo'lsin.

*11-teorema.* Agar  $\{f_n(x)\}$  funksional ketma-ketlikning har bir  $f_n(x)$  ( $n = 1, 2, 3, \dots$ ) hadi  $[a, b]$  segmentda uzlusiz bo'lib, bu funksional ketma-ketlik  $[a, b]$  da tekis yaqinlashuvchi bo'lsa, u holda

$$\int_a^b f_1(x)dx, \int_a^b f_2(x)dx, \dots, \int_a^b f_n(x)dx \dots$$

ketma-ketlik yaqinlashuvchi, uning limiti esa  $\int_a^b f(x)dx$  ga teng, ya'ni

$$\lim_{n \rightarrow \infty} \int_a^b f_n(x)dx = \int_a^b f(x)dx$$

bo'ladi.

Bu teoremadagi limit munosabatni quyidagicha

$$\lim_{n \rightarrow \infty} \int_a^b f_n(x)dx = \int_a^b \lim_{n \rightarrow \infty} f_n(x)dx$$

ham yozish mumkin.

*7<sup>o</sup>. Funksional qatorlarni hadma-had differensiallash.*  $[a, b]$  segmentda yaqinlashuvchi

$$u_1(x) + u_2(x) + \dots + u_n(x) + \dots$$

funksional qator berilgan bo'lib, uning yig'indisi  $S(x)$  bo'lsin:

$$S(x) = \sum_{n=1}^{\infty} u_n(x)$$

*12-teorema.* Agar  $\sum_{n=1}^{\infty} u_n(x)$  qatomning har bir hadi  $u_n(x)$  ( $n = 1, 2, \dots$ )  $[a, b]$  segmentda uzlusiz  $u'_n(x)$  ( $n = 1, 2, \dots$ ) hosilaga ega bo'lib, bu hosilalardan tuzilgan

$$\sum_{n=1}^{\infty} u'_n(x) = u'_1(x) + u'_2(x) + \dots + u'_n(x) + \dots$$

funksional qator  $[a, b]$  da tekis yaqinlashuvchi bo'lsa, u holda berilgan funksional qatomning  $S(x)$  yig'indisi shu  $[a, b]$  da  $S'(x)$  hosilaga ega va

$$S'(x) = \sum_{n=1}^{\infty} u'_n(x)$$

bo'ladi.

◀ Shartga ko'rva

$$u'_1(x) + u'_2(x) + \dots + u'_n(x) + \dots$$

funksional qator  $[a, b]$  da tekis yaqinlashuvchi. Uning yig'indisini  $S(x)$  deylik:

$$\bar{S}(x) = \sum_{n=1}^{\infty} u'_n(x). \text{ Bu } S(x) \text{ funksiya 6-teoremagaga asosan } [a, b] \text{ da uzlusiz bo'ladi.}$$

Funksional qatorni hadma-had integrallash haqidagi 10-teoremadan foydalanib, ushu

$$\bar{S}(x) = \sum_{n=1}^{\infty} u_n'(x)$$

qatorni  $[a, x]$  oraliq ( $a < x \leq b$ ) bo'yicha hadma-had integrallab quyidagini topamiz:

$$\begin{aligned} \int \bar{S}(x) dx &= \sum_{n=1}^{\infty} \left[ \int u_n'(x) dx \right] = \sum_{n=1}^{\infty} [u_n(x) - u_n(a)] = \\ &= \sum_{n=1}^{\infty} u_n(x) - \sum_{n=1}^{\infty} u_n(a) = S(x) - S(a) \end{aligned} \quad (14.19)$$

Modomiki,  $S(x)$  funksiya  $[a, b]$  oraliqda uzlusiz ekan, 1-qism, 6-bob. 4-§ da keltirilgan teoremagaga binoan

$$\int \bar{S}(x) dx$$

funksiya differensialanuvchi bo'lib, uning hosilasi

$$\frac{d}{dx} \left[ \int \bar{S}(x) dx \right] = \bar{S}(x)$$

bo'jadi.

Ikkinci tomondan (14.19) tenglikka ko'tra

$$\frac{d}{dx} (S(x) - S(a)) = S(x)$$

ya'ni

$$S'(x) = \bar{S}(x)$$

bo'lishini topamiz. Demak,  $S'(x) = \sum_{n=1}^{\infty} u_n'(x)$ . ▶

Keyingi tenglikni quyidagicha ham yozish mumkin:

$$\frac{d}{dx} \left( \sum_{n=1}^{\infty} u_n(x) \right) = \sum_{n=1}^{\infty} \frac{d}{dx} u_n(x).$$

Bu esa 12-teoremaning shartlari bajarilganda cheksiz qatorlarda ham hadma-had differensialash qoidasi o'rnti bo'lishini ko'rsatadi.

*8<sup>o</sup>. Funksional ketma-ketliklarni hadma-had differensialash.*  $[a, b]$  segmentda yaqinlashuvchi  $\{f_n(x)\}$ :

$$f_1(x), f_2(x), \dots, f_n(x), \dots$$

funktsional ketma-ketlik berilgan bo'lib, uning limit funksiyasi  $f(x)$  bo'lsin.

*13-teorema.* Agar  $\{f_n(x)\}$  funktsional ketma-ketlikning har bir hadi  $f_n(x)$  ( $n = 1, 2, \dots$ )  $[a, b]$  segmentda uzlusiz  $f_n'(x)$  ( $n = 1, 2, \dots$ ) hosilaga ega bo'lib, bu hosilalardan tuzilgan

$$f_1'(x), f_2'(x), \dots, f_n'(x), \dots$$

funksional ketma-ketlik  $[a, b]$  da tekis yaqinlashuvchi bo'lsa u holda  $f(x)$  limit funksiya shu  $[a, b]$  da  $f'(x)$  hosilaga ega bo'lib.  $\{f'_n(x)\}$  ketma-ketlikning limiti  $f'(x)$  ga teng bo'ladi.

#### 4-§. Darajali qatorlar

*1<sup>o</sup>. Darajali qatorlar. Abel teoremasi.* Biz avvalgi paragraflarda funksional qatorlarni o'rgandik. Funksional qatorlar orasida, utarning xususiy holi bo'lgan ushbu

$$\sum_{n=0}^{\infty} a_n x^n = a_0 + a_1 x + a_2 x^2 + \dots + a_n x^n + \dots \quad (14.20)$$

yoki, umumiyroq,

$$\sum_{n=0}^{\infty} a_n (x - x_0)^n = a_0 + a_1 (x - x_0) + a_2 (x - x_0)^2 + \dots + a_n (x - x_0)^n + \dots \quad (14.21)$$

qatorlar (bunda  $a_0, a_1, a_2, \dots; x_0$  o'zgarmas haqiqiy sonlar) matematikada va uning tadbiqlarida muhim rol o'yndaydi. Bu erda, ushbu bobning 1-§ idagi qaralgan

$\sum_{n=1}^{\infty} u_n(x)$  funksional qatorda qatnashgan  $u_n(x)$  sifatida

$$u_n(x) = a_n x^n \text{ (yoki } u_n(x) = a_n (x - x_0)^n\text{)}$$

ya'ni  $x$  (yoki  $x - x_0$ ) o'zgaruvchining darajalari qaralayapti. Shu sababli (14.20) va (14.21) qatorlar darajali qatorlar deb ataladi.

Agar (14.21) qatorda  $x - x_0 = t$  deb olinsa, u holda bu qator  $t$  o'zgaruvchiga nisbatan (14.20) qator ko'rinishiga keladi. Demak, (14.20) qatorlarni o'rganish kifoyadir.

(14.20) ifodadagi  $a_0, a_1, a_2, \dots, a_n, \dots$  haqiqiy sonlar (14.20) darajali qatoring koeffisientlari deb ataladi.

Darajali qatoring tuzilishidan, darajali qatorlar bir-biridan faqat koeffisientlari bilangina farq qilishni ko'ramiz. Demak, darajali qator berilgan deganda uning koeffisientlari berilgan deganini tushunamiz.

Masalan. ushbu

$$\sum_{n=0}^{\infty} \frac{x^n}{n!} = 1 + \frac{x}{1!} + \frac{x^2}{2!} + \dots + \frac{x^n}{n!} + \dots \quad (0! = 1),$$

$$\sum_{n=0}^{\infty} x^n = 1 + x + x^2 + \dots + x^n + \dots$$

qatorlar darajali qatorlar bo'ladi.

Darajali qatoring yaqinlashish sohasi (to'plami) strukturasini aniqlashda quyidagi Abel teoremasiga asoslaniladi.

*14-teorema. (Abel teoremasi.)* Agar

$$\sum_{n=0}^{\infty} a_n x^n = a_0 + a_1 x + a_2 x^2 + \dots + a_n x^n + \dots \quad (14.20)$$

darajali qator  $x$  ning  $x = x_0$  ( $x_0 \neq 0$ ) qiymatida yaqinlashuvchi bo'lsa.  $x$  ning

$$|x| < |x_0| \quad (14.22)$$

tengsizlikni qanoatlantiruvchi barcha qiymatlarida (14.20) darajali qator absolyut yaqinlashuvchi bo'ladi.

◀ Shartga ko'ra

$$\sum_{n=0}^{\infty} a_n x_0^n = a_0 + a_1 x_0 + a_2 x_0^2 + \dots + a_n x_0^n + \dots$$

qator (sonli qator) yaqinlashuvchi. U holda qator yaqinlashuvchiligining zaruriy shartiga asosan

$$\lim_{n \rightarrow \infty} a_n x_0^n = 0$$

bo'ladi. Demak,  $\{a_n x_0^n\}$  ketma-ketlik chegaralangan, ya'ni  $\forall n \in N$  uchun

$$|a_n x_0^n| \leq M \quad (M \in R)$$

tengsizlik hajariladi. Bu tengsizlikni etiborga olib quyidagini topamiz:

$$|a_n x^n| = |a_n x_0^n| \left| \frac{x}{x_0} \right|^n \leq M \left| \frac{x}{x_0} \right|^n.$$

Endi ushbu

$$\sum_{n=0}^{\infty} |a_n x^n| = |a_0| + |a_1 x| + |a_2 x^2| + \dots + |a_n x^n| + \dots \quad (14.23)$$

qator bilan birga quyidagi

$$\sum_{n=0}^{\infty} M \left| \frac{x}{x_0} \right|^n = M + M \left| \frac{x}{x_0} \right| + M \left| \frac{x}{x_0} \right|^2 + \dots + M \left| \frac{x}{x_0} \right|^n + \dots \quad (14.24)$$

qatorni qaraylik. Bunda, birinchidan (14.24) qator yaqinlashuvchi (chunki bu qator geometrik qator bo'lib, uning mahrajisi (14.22) ga ko'ra 1 dan kichik:  $\left| \frac{x}{x_0} \right| < 1$ ), ikkinchidan (14.23) qatorning har bir hadi (14.24) qatorning mos hadidan katta emas. U holda 1-qism, 2-bob, 3-§ da keltirilgan teoremgaga ko'ra (14.23) qator yaqinlashuvchi bo'ladi. Demak, berilgan (14.20) darajali qator absolyut yaqinlashuvchi. ▶

*I-natija.* Agar

$$\sum_{n=0}^{\infty} a_n x^n = a_0 + a_1 x + a_2 x^2 + \dots + a_n x^n + \dots$$

darajali qator  $x$  ning  $x = x_0$  qiymatida uzoqlashuvchi bo'lsa,  $x$  ning  $|x| > |x_0|$  tengsizlikni qanoatlantiruvchi barcha qiymatlarida uzoqlashuvchi bo'ladi.

◀ Berilgan (14.20) darajali qator  $x_0$  nuqtada uzoqlashuvchi bo'lsin.

Unda bu qator  $x$  ning  $|x| > |x_0|$  tengsizlikni qanoatlantiruvchi qiymatlarida ham uzoqlashuvchi bo'ladi, chunki (14.20) qator  $x$  ning  $|x| > |x_0|$  tengsizlikni qanoatlantiruvchi biror  $x = x_1$  qiymatida yaqinlashuvchi bo'ladigan bo'lsin, unda Abel teoremasiga ko'ra bu qator  $x = x_0$  ( $|x_0| < |x_1|$ ) nuqtada ham yaqinlashuvchi bo'lib qoladi. Bu esa (14.20) qatorning  $x = x_0$  da uzoqlashuvchi deyilishiga ziddir. ▶

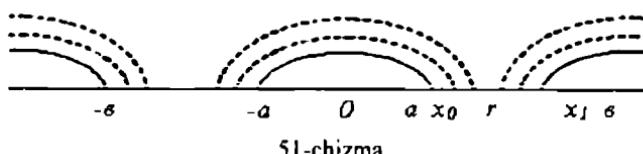

**2°. Darajali qatorning yaqinlashish radiusi va yaqinlashish intervali.** Endi darajali qatorning yaqinlashish sohasi strukturasini aniqlaylik.

**15-teorema.** Agar

$$\sum_{n=0}^{\infty} a_n x^n = a_0 + a_1 x + a_2 x^2 + \dots + a_n x^n + \dots \quad (14.20)$$

darajali qator  $x$  ning ba'zi ( $x \neq 0$ ) qiymatlarida yaqinlashuvchi, ba'zi qiymatlarida uzoqlashuvchi bo'lsa, u holda shunday yagona  $r > 0$  haqiqiy son topiladiki (14.20) darajali qator  $x$  ning  $|x| < r$  tengsizlikni qanoatlantiruvchi qiymatlarida absolyut yaqinlashuvchi,  $|x| > r$  tengsizlikni qanoatlantiruvchi qiymatlarida esa uzoqlashuvchi bo'ladi.

◀ Berilgan (14.20) darajali qator  $x = x_0 \neq 0$  da yaqinlashuvchi,  $x = x_1$  da uzoqlashuvchi bo'lsin. Ravshanki,  $|x_0| < |x_1|$  bo'ladi. Unda 14-teorema hamda 1-natijaga muvofiq (14.20) darajali qator  $x$  ning  $|x| < |x_0|$  tengsizlikni qanoatlantiruvchi qiymatlarida absolyut yaqinlashuvchi,  $x$  ning  $|x| > |x_1|$  tengsizlikni qanoatlantiruvchi qiymatlarida esa uzoqlashuvchi bo'ladi. Jumladan (14.20) darajali qator  $a$  ( $a < |x_0|$ ) nuqtada yaqinlashuvchi,  $a$  ( $a < |x_1|$ ) nuqtada esa uzoqlashuvchi bo'ladi (51-chizma).

51-chizma

Demak, (14.20) qator  $[a, \epsilon]$  segmentning chap chekkasida yaqinlashuvchi, o'ng chekkasida esa uzoqlashuvchi.

$[a, \epsilon]$  segmentning o'rtasi  $\frac{a+\epsilon}{2}$  nuqtani olib, bu nuqtada (14.20) qatorni qaraylik. Agar (14.20) qator  $\frac{a+\epsilon}{2}$  nuqtada yaqinlashuvchi bo'lsa, unda  $\left[ \frac{a+\epsilon}{2}, \epsilon \right]$  segmentni,  $\frac{a+\epsilon}{2}$  nuqtada uzoqlashuvchi bo'lsa,  $\left[ a, \frac{a+\epsilon}{2} \right]$  segmentni olib, uni  $[a_1, \epsilon_1]$  orqali belgilaylik. Demak, (14.20) qator  $a_1$  nuqtada yaqinlashuvchi,  $\epsilon_1$  nuqtada esa uzoqlashuvchi bo'lib,  $[a, \epsilon]$  segmentning uzunligi  $\epsilon_1 - a_1 = \frac{\epsilon - a}{2}$  ga teng bo'ladi.

So'ng  $[a_1, \epsilon_1]$  segmentning o'rtasi  $\frac{a_1+\epsilon_1}{2}$  nuqtani olib, bu nuqtada (14.20) qatorni qaraymiz. Agar u  $\frac{a_1+\epsilon_1}{2}$  nuqtada yaqinlashuvchi bo'lsa, unda

$\left[ \frac{a_1 + \epsilon_1}{2}, a_1 \right]$  segmentni, uzoqlashuvchi bo'lsa,  $\left[ a_1, \frac{a_1 + \epsilon_1}{2} \right]$  segmentni olib, uni  $[a_2, \epsilon_2]$  orqali belgilaymiz. Demak, (14.20) qator  $a_2$  nuqtada yaqinlashuvchi,  $\epsilon_2$  nuqtada esa uzoqlashuvchi bo'lib,  $[a_2, \epsilon_2]$  segmentning uzunligi  $\epsilon_2 - a_2 = \frac{\epsilon_1 - \epsilon_0}{2}$  ga teng bo'ladi. Shu jarayonni davom ettiraveramiz. Natijada ichma-ich joylashgan  $[a_1, \epsilon_1], [a_2, \epsilon_2], \dots, [a_n, \epsilon_n], \dots$

segmentlar ketma-ketligi hosil bo'ladi. Bu segmentlarning har birining chap chekkasida ( $a_n$  nuqtalarda) (14.20) qator yaqinlashuvchi, o'ng chekkasida esa ( $\epsilon_n$  nuqtalarda) uzoqlashuvchi,  $n \rightarrow \infty$  da bu segmentlar uzunligi nolga intila boradi

$$(a_n - a_{n-1}) - \frac{\epsilon_n - \epsilon_{n-1}}{2} \rightarrow 0.$$

Unda ichma-ich joylashgan segmentlarga prinsipiqa ko'ra (qaralsin, I-qism, 3-boh, 8-§) shunday yagona  $r$  soni topiladiki,

$$\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \epsilon_n = r$$

bo'lib, bu  $r$  nuqta barcha segmentlarga tegishli bo'ladi.

Endi  $x$  o'zgaruvchining  $|x| < r$  tengsizlikni qanoatlantiruvchi ixtiyoriy qiymatini qaraylik.  $\lim_{n \rightarrow \infty} a_n = r$  bo'lgani sababli, shunday natural  $n_0$  soni topiladiki,  $|x| < a_{n_0} < r$  bo'ladi.  $a_{n_0}$  nuqtada (14.20) qator yaqinlashuvchi. Demak, 14-teoremagaga ko'ra  $x$  nuqtada ham (14.20) darajali qator yaqinlashuvchi bo'ladi.

$x$  o'zgaruvchining  $|x| > r$  tengsizlikni qanoatlantiruvchi ixtiyoriy qiymatini qaraylik.  $\lim_{n \rightarrow \infty} \epsilon_n = r$  bo'lgani sababli, shunday natural  $n_1$  soni topiladiki,  $|x| > \epsilon_{n_1} > r$  bo'ladi.  $\epsilon_{n_1}$  nuqtada (14.20) qator uzoqlashuvchi. Unda 1-natijaga ko'ra  $x$  da (14.20) qator uzoqlashuvchi bo'ladi.

Shunday qilib, shunday  $r$  soni topiladiki (14.20) darajali qator  $x$  ning  $|x| < r$  tengsizlikni qanoatlantiruvchi qiymatlarida absolyut yaqinlashuvchi,  $|x| > r$  tengsizlikni qanoatlantiruvchi qiymatlarida esa uzoqlashuvchi bo'ladi. ►

**9-ta'rif.** Yuqoridagi 15-teoremada topilgan  $r$  soni (14.20) darajali qatorning yaqinlashish radiusi,  $(-r, r)$  interval esa (14.20) darajali qatorning yaqinlashish intervali deb ataladi.

**4-eslatma.** 15-teorema  $x$  ning  $x = \pm r$  qiymatlarida (14.20) darajali qatorning yaqinlashuvchi yoki uzoqlashuvchi bo'lishi to'g'risida xulosa chiqarib bermaydi. Bu  $x = \pm r$  nuqtalarda (14.20) darajali qator yaqinlashuvchi ham bo'lishi mumkin, uzoqlashuvchi ham bo'lishi mumkin.

Masalan,

$I/x$  Ushbu

$$1 + x + x^2 + \dots + x^n +$$

darajali qator (geometrik qator) ning yaqinlashish radiusi  $r = 1$  yaqinlashish intervali  $(-1, +1)$  bo'lib, intervalning chekka nuqtalari  $r = \pm 1$  da uzoqlashuvchi:

2) Quyidagi

$$1 + \frac{x}{1^2} + \frac{x^2}{2^2} + \frac{x^3}{3^2} + \dots + \frac{x^n}{n^2} + \dots$$

qatorning yaqinlashish radiusi  $r = 1$ , yaqinlashish intervali  $(-1, +1)$ .  $r = \pm 1$  da qator yaqinlashuvchi bo'lib, yaqinlashish sohasi (to'plami)  $[-1, +1]$  segmentdan iborat:

3) Ushbu

$$\frac{1}{1} - \frac{x^2}{2} + \frac{x^3}{3} - \dots + (-1)^{n-1} \frac{x^n}{n} + \dots$$

darajali qatorning yaqinlashish radiusi  $r = 1$  yaqinlashish intervali  $(-1, +1)$ . Qator  $r = 1$  da yaqinlashuvchi,  $r = -1$  da esa uzoqlashuvchidir, qatorning yaqinlashish sohasi  $(-1, +1]$  yarim intervalidan iborat.

**2-eslatma.** Shunday darajali qotorlar ham borki, ular faqat  $x = 0$  nuqtadagina yaqinlashuvchi bo'ladi. Masalan,  $\sum_{n=0}^{\infty} n! x^n$  qator istalgan  $x_0 \neq 0$  nuqtada uzoqlashuvchidir. Haqiqatdan ham, Dalamber alomatiga ko'ra

$$\lim_{n \rightarrow \infty} \left| \frac{(n+1)! x_0^{n+1}}{n! x_0^n} \right| = \lim_{n \rightarrow \infty} (n+1)x_0 = \infty$$

bo'ladi. Demak,  $\sum_{n=0}^{\infty} n! x^n$  qator istalgan  $x \neq 0$  da uzoqlashuvchi. Bunday darajali qotorlarning yaqinlashish radiusini  $r = 0$  deb olamiz.

Ayni vaqtida shunday darajali qotorlar ham borki, ular ixtiyoriy  $x \in (-\infty, +\infty)$  da yaqinlashuvchi bo'ladi. Masalan,  $\sum_{n=0}^{\infty} \frac{x^n}{n!}$  ni olaylik. Bu qator istalgan  $x_0$  nuqtada yaqinlashuvchidir. Haqiqatdan ham, yana Dalamber alomatiga ko'ra

$$\lim_{n \rightarrow \infty} \left| \frac{x_0^{n+1}}{(n+1)!} \cdot \frac{n!}{x_0^n} \right| = \lim_{n \rightarrow \infty} \frac{|x_0|}{n+1} = 0$$

bo'ladi. Demak, bu qator istalgan  $x \in (-\infty, +\infty)$  da yaqinlashuvchi. Bunday darajali qotorlarning yaqinlashish radiusi  $r = +\infty$  deb olinadi.

**3°. Koshi-Adamar teoremasi.** Yuqorida ko'rdikki, darajali qotorlarning yaqinlashish sohasi sodda strukturaga ega bo'lar ekan: yoki interval yoki yarim interval, yoki segment. Hamma hollarda ham bu soha yaqinlashish radiusi  $r$  orqali ifodalanadi.

Ma'lumki, har qanday darajali qator

$$\sum_{n=0}^{\infty} a_n x^n = a_0 + a_1 x + a_2 x^2 + \dots + a_n x^n + \dots$$

o'zining koefisientlari ketma-ketligi  $\{a_n\}$  bilan aniqlanadi. Binobarin, uning yaqinlashish radiusi ham shu koefisientlar ketma-ketligi orqali qandaydir topilishi kerak.

(14.20) darajali qator koefisientlari yordamida  $\sqrt[n]{|a_n|}$ :

$$|a_0|, |a_1|, \sqrt{|a_2|}, \dots, \sqrt[n]{|a_n|}, \dots \quad (14.25)$$

sonlar ketma-ketligi tuzamiz. Ma'lumki, har qanday sonlar ketma-ketligini yuqori limiti mavjud (qaralsin. 1-qism, 3-bo'b, 2-\$). Demak, (14.25) ketma-ketlik ham yuqori limitga ega. Uni  $\epsilon$  bilan belgitaylik:

$$\epsilon = \lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} \quad (0 < \epsilon \leq +\infty).$$

**16-teorema (Koshi-Adamar teoremasi).** Eterilgan  $\sum_{n=0}^{\infty} a_n x^n$  darajali qatorning yaqinlashish radiusi

$$r = \frac{1}{\epsilon} = \frac{1}{\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|}} \quad (14.26)$$

bo'ldi.

((14.26) formulada  $\epsilon = 0$  bo'lganda  $r = +\infty$ ,  $\epsilon = +\infty$  bo'lganda esa  $r = 0$  deh olinadi).

◀ (14.26) formulaning to'g'riligini ko'rsatishda quyidagi

1)  $\epsilon = +\infty$  ( $r = 0$ );

2)  $\epsilon = 0$  ( $r = +\infty$ );

3)  $0 < \epsilon < +\infty$  ( $r = \frac{1}{\epsilon}$ )

hotlarni alohida-alohida qaraymiz.

1)  $\epsilon = \infty$  bo'lsin. Bu holda  $\sqrt[n]{|a_n|}$  ketma-ketlik chegaralanmagandir. Ixtiyoriy  $x_0$  ( $x_0 \neq 0$ ) nuqtani olib, bu nuqtada (14.20) darajali qatorning uzoqlashuvchi ekanini ko'rsatamiz. Teskarisini faraz qilaylik, ya'ni shu  $x_0$  nuqtada (14.20) darajali qator yaqinlashuvchi bo'lsin.

Demak,  $\sum_{n=0}^{\infty} a_n x_0^n$  qator (sonli qator) yaqinlashuvchi. Unda qator yaqinlashuvchi-ligining zaruriy shartiga asosan

$$\lim_{n \rightarrow \infty} a_n x_0^n = 0$$

bo'ldi. Demak,  $\{a_n x_0^n\}$  ketma-ketlik chegaralangan, ya'ni shunday o'zgarmas  $M$  son mavjudki (uni 1 dan katta qilib olish mumkin),  $\forall n \in N$  uchun

$$|a_n x_0^n| < M \quad (M > 1)$$

tengsizlik bajariladi. Bu tengsizlikdan

$$\sqrt[n]{|a_n|} \cdot |x_0| \leq \sqrt[n]{M} < M$$

ya'ni

$$\sqrt[n]{|a_n|} < \frac{M}{|x_0|}$$

bo'lishi kelib chiqadi. Shunday qilib  $\sqrt{|a_n|}$  ketma-ketlik chegaralangan bo'lib qoldi. Natija ziddiyatlik yuzaga keldi. Ziddiyatlikning kelib chiqishiga sabab  $x_0 \neq 0$  nuqtada (14.20) qatorning yaqinlashuvchi bo'lsin deb olinishidir. Demak, (14.20) darajali qator ixtiyoriy  $x_0$  ( $x_0 \neq 0$ ) nuqtada uzoqlashuvchi.

2)  $\epsilon = 0$  bo'lsin. Bu holda ixtiyoriy  $x_0$  ( $x_0 \neq 0$ ) nuqtada (14.20) darajali qatorning yaqinlashuvchi bo'lishini ko'rsatamiz. Modomiki,  $\sqrt{|a_n|}$  ketma-ketlikning yuqori limiti nolga teng ekan bundan uning limiti ham mavjud va nolga tengligi kelib chiqadi. Ta'rifga asosan  $\forall \epsilon > 0$  son olinganda ham, jumladan

$$\epsilon = \frac{1}{2|x_0|} \text{ ga ko'ra shunday } n_0 \in N \text{ topiladiki, barcha } n > n_0 \text{ uchun}$$

$$\sqrt{|a_n|} < \frac{1}{2|x_0|}$$

bo'ladi. Keyingi tengsizlikdan esa

$$|a_n x_0| < \frac{1}{2^n}$$

bo'lishi kelib chiqadi.

Ravshanki.

$$\sum_{n=0}^{\infty} \frac{1}{2^n}$$

qator yaqinlashuvchi. Taqqoslash teoremasiga ko'ra (qaralsin, 1-qism, 2-bob, 3-§).

$$\sum_{n=0}^{\infty} |a_n x_0^n|$$

qator ham yaqinlashuvchi bo'ladi. Demak,

$$\sum_{n=0}^{\infty} a_n x_0^n$$

qator absolyut yaqinlashuvchi.

$$3) 0 < \alpha < +\infty \text{ bo'lsin. Bu holda (14.20) darajali qator ixtiyoriy } x_0 \left( |x_0| < \frac{1}{\alpha} \right)$$

nuqtada yaqinlashuvchi, ixtiyoriy  $x_1$   $\left( |x_1| > \frac{1}{\alpha} \right)$  nuqtada uzoqlashuvchi bo'lishini ko'rsatamiz.

$|x_0| < \frac{1}{\alpha}$  bo'lsin. U holda shunday  $\delta > 0$  sonni topish mumkinki,  $|x_0| = \frac{1}{\alpha + \delta}$  bo'ladi. Endi  $\delta_1$  ( $0 < \delta_1 < \delta$ ) sonni olaylik. Bu  $\delta_1 > 0$  songa ko'ra shunday  $n_0 \in N$  topiladiki, barcha  $n > n_0$  uchun (yuqori limitning xossasiga ko'ra, 1-qism, 3-bob, 2-§)  $\sqrt{|a_n|} < \alpha + \delta_1$ , ya'ni  $|a_n| < (\alpha + \delta_1)^2$  bo'ladi. Demak, barcha  $n > n_0$  uchun

$$|a_n x_0^n| = |a_n|^n \cdot |x_0^n| < (\varepsilon + \delta_1)^n \frac{1}{(\varepsilon + \delta)^n} = \left( \frac{\varepsilon + \delta_1}{\varepsilon + \delta} \right)^n. \quad (14.27)$$

bo'lishi kelib chiqadi, bunda

$$\frac{\varepsilon + \delta_1}{\varepsilon + \delta} = \frac{(\varepsilon + \delta) - (\delta - \delta_1)}{\varepsilon + \delta} = \frac{\delta - \delta_1}{\varepsilon + \delta} < 1.$$

Endi ushbu

$$\sum_{n=0}^{\infty} |a_n x_0^n| = |a_0| + |a_1 x_0| + |a_2 x_0^2| + \dots + |a_n x_0^n| + \dots \quad (14.28)$$

qator bilan quyidagi

$$\sum_{n=0}^{\infty} \left( \frac{\varepsilon + \delta_1}{\varepsilon + \delta} \right)^n = 1 + \left( \frac{\varepsilon + \delta_1}{\varepsilon + \delta} \right) + \left( \frac{\varepsilon + \delta_1}{\varepsilon + \delta} \right)^2 + \dots + \left( \frac{\varepsilon + \delta_1}{\varepsilon + \delta} \right)^n + \dots \quad (14.29)$$

qatorni solishtiraylik. Bunda, birinchidan, (14.29) qator yaqinlashuvchi (chunki bu qator geometrik qator bo'lib, uning mahraji  $0 < \frac{\varepsilon + \delta_1}{\varepsilon + \delta} < 1$ ) ikkinchidan,  $n$  ning biror qiymatidan boshlab ( $n > n_0$ ) (14.27) munosabatga ko'ra (14.28) qatorning har hir hadi (14.29) qatorning mos hadidan katta emas. Unda qatorlar nazariyasida keltirilgan taqqoslash teoremasiga 1-qism, 3-bob, 2-§) ko'ra (14.28) qator yaqinlashuvchi bo'ladi.

$|x_i| > \frac{1}{\varepsilon}$  bo'lsin. Unda shunday  $\delta' > 0$  sonni topish mumkinki,

$$|x_i| = \frac{1}{\varepsilon - \delta'}$$

bo'ladi. Endi  $\delta'_i$  ( $0 < \delta'_i < \delta'$ ) sonni olaylik. Yuqori limitning xossasiga asosan (1-qism, 3-bob, 2-§)  $\sqrt[n]{|a_n|}$  ketma-ketlikning ushbu

$$\sqrt[n]{|a_n|} > \varepsilon - \delta'_i, \text{ ya'ni } |a_n| > (\varepsilon - \delta'_i)^n$$

tengsizlikni qanoatlantiradigan hadlarining soni cheksiz ko'p bo'ladi. Demak, bu holda

$$|a_n x_1^n| = |a_n| \cdot |x_1^n| > (\varepsilon - \delta'_i)^n \cdot \frac{1}{(\varepsilon - \delta')^n} = \left( \frac{\varepsilon - \delta'_i}{\varepsilon - \delta'} \right)^n \quad (14.30)$$

bo'lib, bunda

$$\frac{\varepsilon - \delta'_i}{\varepsilon - \delta'} = \frac{(\varepsilon - \delta') + (\delta' - \delta'_i)}{\varepsilon - \delta'} = 1 + \frac{\delta' - \delta'_i}{\varepsilon - \delta'} > 1$$

bo'ladi.

Yuqoridagi (14.30) munosabatdan  $n \rightarrow \infty$  da  $\{a_n x_1^n\}$  ketma-ketlikning limiti nolga teng emasligini topamiz. Demak,

$$\sum_{n=0}^{\infty} a_n x_1^n$$

qator uzoqlashuvchi (qator yaqinlashuvchiligining zaruriy sharti bajarilmaydi).

Shunday qilib, har bir  $x_0$   $\left(|x_0| < \frac{1}{\epsilon}\right)$  nuqtada (14.20) darajali qator yaqinlashuvchi, har bir  $x_1$   $\left(|x_1| > \frac{1}{\epsilon}\right)$  nuqtada esa shu darajali qator uzoqlashuvchi bo'lar ekan.

Darajali qatorning yaqinlashish radiusi ta'rifini etiborga olib,  $\frac{1}{d}$  berilgan darajali qatorning yaqinlashish radiusi ekanini topamiz. ►

#### 14.10-misol. Ushbu

$$\sum_{n=1}^{\infty} \frac{x^n}{2^{\sqrt{n}}} = \frac{x}{2} + \frac{x^2}{2^{\sqrt{2}}} + \dots + \frac{x^n}{2^{\sqrt{n}}} + \dots$$

darajali qatorni yaqinlashish sohasi topilsin.

◀ Bu darajali qatorning yaqinlashish radiusini (14.26) formulaga ko'ra topamiz:

$$r = \frac{1}{\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|}} = \frac{1}{\lim_{n \rightarrow \infty} \sqrt[n]{\frac{1}{2^n}}} = \lim_{n \rightarrow \infty} 2^n = 1.$$

Demak, berilgan darajali qatorning yaqinlashish radiusi  $r=1$  yaqinlashish intervali esa  $(-1, +1)$  dan iborat. Bu darajali qator yaqinlashish intervalining chekkalarida mos ravishda quyidagi

$$\sum_{n=1}^{\infty} \frac{(-1)^n}{2^{\sqrt{n}}}, \quad \sum_{n=1}^{\infty} \frac{1}{2^{\sqrt{n}}}$$

sonli qatorlarga aylanib, ulami Leybnis teoremasi hamda Raabe alomatidan foydalanib yaqinlashuvchi ekanligini isbotlash qiyin emas.

Demak, berilgan darajali qatorning yaqinlashish sohasi  $[-1, 1]$  segmentdan iborat. ►

#### 14.11-misol. Ushbu

$$1 + \frac{x}{2} + \frac{x^2}{3 \cdot 5} + \dots + \frac{x^n}{(n+1) \cdot 5^n} + \dots$$

darajali qatorning yaqinlanish sohasi topilsin.

◀ Bu qatorga Dalamher alomati (1-qism, 3-bob. 4-§) ni qo'llab quyidagi ni topamiz:

$$d = \lim_{n \rightarrow \infty} \left| \frac{x^{n+1}}{(n+2) \cdot 5^{n+1}} - \frac{x^n}{(n+1) \cdot 5^n} \right| = \lim_{n \rightarrow \infty} \left| \frac{(n+1) \cdot 5^n x^{n+1}}{(n+2) \cdot 5^{n+1} \cdot x^n} \right| = \frac{|x|}{5} \lim_{n \rightarrow \infty} \frac{n+1}{n+2} = \frac{|x|}{5}.$$

Demak,  $\frac{|x|}{5} < 1$  ya'ni  $|x| < 5$  bo'lganda qator yaqinlashuvchi,  $\frac{|x|}{5} > 1$  ya'ni  $|x| > 5$  bo'lganda qator uzoqlashuvchi.

Shunday qilib, berilgan darajali qatorning yaqinlashish radiusi  $r=5$ , yaqinlashish intervali esa  $(-5, +5)$  bo'ladi.

Yaqinlashish intervali  $(-5, +5)$  ning chekkalarida darajali qator mos ravishda

$$1 - \frac{1}{2} + \frac{1}{3} - \dots + (-1)^{n+1} \frac{1}{n} + \dots$$

$$1 + \frac{1}{2} + \frac{1}{3} + \dots + \frac{1}{n} + \dots$$

sonli qatorlarga aylanib, bu qatorlarning birinchisi yaqinlashuvchi, ikkinchisi esa uzoqlashuvchidir. Demak, berilgan darajali qatorning yaqinlashish sohasi  $[-5, +5]$  yarim intervaldan iborat ekan. ▶

### 5-§. Darajali qatorlarning xossalari

Biror

$$\sum_{n=0}^{\infty} a_n x^n = a_0 + a_1 x + a_2 x^2 + \dots + a_n x^n + \dots \quad (14.20)$$

darajali qator berilgan bo'lsin.

**17-teorema.** Agar  $\sum_{n=0}^{\infty} a_n x^n$  darajali qatorning yaqinlashish radiusi  $r$  ( $r > 0$ ) bo'lsa, u holda bu qator  $[-c, c]$  ( $0 < c < r$ ) segmentda tekis yaqinlashuvchi bo'ladi.

◀ Shartga ko'ra,  $r$  (14.20) darajali qatorning yaqinlashish radiusi. Demak, berilgan qator  $(-r, r)$  intervalda yaqinlashuvchi. Jumladan,  $c < r$  bo'lganligidan (14.20) darajali qator  $c$  nuqtada ham yaqinlashuvchi (absolyut yaqinlashuvchi) bo'ladi. Demak,

$$\sum_{n=0}^{\infty} |a_n| c^n = |a_0| + |a_1| c + |a_2| c^2 + \dots + |a_n| c^n + \dots \quad (14.31)$$

qator yaqinlashuvchi.

$\forall x \in [-c, c]$  uchun har doim  $|a_n x^n| \leq |a_n| c^n$  bo'ladi. Natijada, ushbu

$$\sum_{n=0}^{\infty} |a_n x^n| = |a_0| + |a_1 x| + |a_2 x^2| + \dots + |a_n x^n| + \dots$$

qatorning har bir hadi (14.31) qatorning mos hadidan katta emasligini topamiz. U holda Veyersstrass alomatiga ko'ra  $\sum_{n=0}^{\infty} a_n x^n$  darajali qator  $[-c, c]$  segmentda tekis yaqinlashuvchi bo'ladi. ▶

**18-teorema.** Agar  $\sum_{n=0}^{\infty} a_n x^n$  darajali qatorning yaqinlashish radiusi  $r > 0$  bo'lsa, u holda bu qatorning  $S(x) = \sum_{n=0}^{\infty} a_n x^n$  yig'indisi  $(-r, r)$  oraliqdagi uzliksiz funksiya bo'ladi.

◀ (14.20) darajali qatorning yaqinlashish intervali  $(-r, r)$  dan ixtiyoriy  $x_0$  ( $x_0 \in (-r, r)$ ) nuqtani olamiz. Ravshanki,  $|x_0| < r$  bo'ladi. Ushbu  $|x_0| < c < r$

tengsizliklarni qanoatlantiruvchi  $c$  sonni olaylik. (14.20) darajali qator yuqorida keltirilgan 17-teoremlaga ko'ra  $[-c, c]$  segmentda tekis yaqinlashuvchi bo'ladi. Unda ushbu bobning 3-§ idagi 6-teoremlaga asosan, berilgan (14.20) darajali qatorning yig'indisi  $S(x)$  funksiya  $[-c, c]$  da, va demak,  $x_0$  nuqtada uzlusiz bo'ladi. Demak, (14.20) qatorning yig'indisi  $S(x)$  funksiya  $(-r, r)$  intervalda uzlusizdir. ►

**19-teorema.** Agar  $\sum_{n=0}^{\infty} a_n x^n$  darajali qatorning yaqinlashish radiusi  $r$  ( $r > 0$ ) bo'lsa, bu qatorni  $[a, a]$  ( $[a, a] \subset (-r, r)$ ) oraliqda hadma-had integrallash mumkin.

◀ Shunday  $c$  ( $0 < c < r$ ) topa olamizki,  $[a, a] \subset [-c, c] \subset (-r, r)$  bo'ladi.

Berilgan darajali qator  $[-c, c]$  da tekis yaqinlashuvchi bo'ladi. Demak,  $[a, a]$  da (14.20) darajali qator tekis yaqinlashuvchi. Unda (14.20) qatorning yig'indisi

$$S(x) = \sum_{n=0}^{\infty} a_n x^n = a_0 + a_1 x + a_2 x^2 + \dots + a_n x^n + \dots$$

uzlusizlik bo'lib, ushbu bobning 5-§ da keltirilgan teoremlaga ko'ra bu qatorni hadma-had integrallash mumkin:

$$\int_a^b S(x) dx = \int_a^b \sum_{n=0}^{\infty} a_n x^n dx = \sum_{n=0}^{\infty} a_n \int_a^b x^n dx = \sum_{n=0}^{\infty} a_n \frac{a^{n+1} - b^{n+1}}{n+1}. \rightarrow$$

Xususan,  $a = 0$ ,  $b = x$  ( $|x| < r$ ) bo'lganda

$$\int_0^x S(x) dx = \sum_{n=0}^{\infty} \frac{a_n}{n+1} x^{n+1} = a_0 x + \frac{a_1}{2} x^2 + \dots + \frac{a_{n-1}}{n} x^n + \dots$$

bo'ladi. Bu qatorning yaqinlashish radiusi ham  $r$  ga teng. Haqiqatdan ham, Koshi-Adamar teoremasidan foydalanib quyidagini topamiz:

$$\lim_{n \rightarrow \infty} \sqrt[n]{\left| \frac{a_n}{n+1} \right|} = \lim_{n \rightarrow \infty} \sqrt[n]{\frac{|a_n|}{n+1}} = \lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} \cdot \lim_{n \rightarrow \infty} \frac{1}{\sqrt[n]{n+1}} = \lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = r.$$

**20-teorema.**  $\sum_{n=0}^{\infty} a_n x^n$  darajali qatorning yaqinlashish radiusi  $r$  bo'lsa,  $(-r, r)$  da bu qatorni hadma-had differensiallash mumkin.

◀ Avvalo berilgan (14.20) darajali qator hadlarining hosilalaridan tuzilgan ushbu

$$\sum_{n=0}^{\infty} n a_n x^{n-1} = a_1 + 2a_2 x + 3a_3 x^2 + \dots + n a_n x^{n-1} + \dots \quad (14.32)$$

qatorning  $|x_0| < r$  tengsizlikni qanoatlantiruvchi ixtiyoriy nuqtada yaqinlashuvchi bo'lishini ko'rsatamiz. Quyidagi  $|x_0| < c < r$  tengsizliklarni qanoatlantiruvchi  $c$

sonni olaylik. Unda  $\frac{1}{c} |x_0| = q < 1$  bo'lib,

$$\left| n a_n x_0^{n-1} \right| = n q^{n-1} \cdot \frac{1}{c} |a_n c^n|$$

bo'ladi. Ravshanki.  $\sum_{n=1}^{\infty} nq^{n-1}$  ( $q < 1$ ) qator yaqinlashuvchi (uni Dalamber alomatiga ko'ra ko'rsatish qiyin emas). Unda

$$\lim_{n \rightarrow \infty} nq^{n-1} = 0$$

bo'ladi. Demak,  $n$  ning biror,  $n_0$  qiymatidan boshlab. ( $n > n_0$  uchun)  $nq^{n-1} < c$  bo'lib, natijada  $\forall n > n_0$  uchun ushbu

$$|na_n x_0^{n-1}| \leq |a_n c^n| \quad (14.33)$$

tengsizlikka kelamiz.

$c \in (-r, r)$  bo'lganligi sababli  $\sum_{n=0}^{\infty} a_n c^n$  qator absolyut yaqinlashuvchi. Unda (14.33) munosabatni hisobga olib, Veyershass alomatidan foydalanib,  $\sum_{n=0}^{\infty} na_n x^{n-1}$  qatorning  $(-r, r)$  da yaqinlashuvchi bo'lishini topamiz. Demak, bu qator  $[-c, c]$  da tekis yaqinlashuvchi bo'ladi.

Shunday qilib, berilgan (14.20) darajali qator hadlarining hosilalaridan tuzilgan (14.32) qator tekis yaqinlashuvchi. U holda ushbu bobning 6-§ da keltirilgan 12-teoreemaga ko'ra

$$S'(x) = \left( \sum_{n=0}^{\infty} a_n x^n \right)' = \sum_{n=0}^{\infty} a_n (x^n)' = \sum_{n=0}^{\infty} n a_n x^{n-1}$$

bo'ladi. ▶

Shuni ham aytish kerakki, (14.20) va (14.32) qatorlarning yaqinlashish radiuslari bir xil bo'ladi. Haqiqatdan ham Koshi-Adamar teoremasidan foydalanih quyidagini topamiz:

$$\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = \lim_{n \rightarrow \infty} \sqrt[n]{\sqrt[n]{|a_n|}} = \lim_{n \rightarrow \infty} \sqrt[n]{n} \cdot \lim_{n \rightarrow \infty} \sqrt[n]{|a_n|}.$$

Demak,

$$\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = \lim_{n \rightarrow \infty} \sqrt[n]{|a_n|}.$$

**2-natija.** Agar (14.20) darajali qatorning yaqinlashish radiusi  $r$  bo'lsa, bu qatori  $(-r, r)$  da istalgan marta differensiallash mumkin.

Shunday qilib, yaqinlashish radiusi  $r > 0$  bo'lgan  $\sum_{n=0}^{\infty} a_n x^n$  darajali qatorni hadma-had integrallash va hadma-had (istalgan marta) differensiallash mumkin va hosil bo'lgan darajali qatorlarning yaqinlashish radiusi ham  $r$  ga teng bo'ladi.

**10-ta'rif.** Agar  $f(x)$  funksiya  $(-r, r)$  da yaqinlashuvchi darajali qatorning yig'indisi bo'lsa,  $f(x)$  funksiya  $(-r, r)$  da analitik deb ataladi.

**21-teorema.** Ikkita

$$\sum_{n=0}^{\infty} a_n x^n = a_0 + a_1 x + a_2 x^2 + \dots + a_n x^n + \dots \quad (14.20)$$

va

$$\sum_{n=0}^{\infty} a_n x^n = a_0 + a_1 x + a_2 x^2 + \dots + a_n x^n + \dots \quad (14.34)$$

darajali qatorlar berilgan bo'lib, (14.20) darajali qatorning yaqinlashish radiusi  $r_1 > 0$  yig'indisi esa  $S_1(x)$ , (14.34) darajali qatorning yaqinlashish radiusi  $r_2 > 0$  yig'indisi  $S_2(x)$  bo'linsin.

Agar  $\forall x \in (-r, r)$  ( $r = \min(r_1, r_2)$ ) da

$$S_1(x) = S_2(x) \quad (14.35)$$

bo'lsa, u holda  $\forall n \in N$  uchun

$$a_n = b_n$$

ya'ni (14.20) va (14.32) darajali qatorlar bir xil bo'ladi.

◀ Ravshanki, (14.20) va (14.32) darajali qatorlar  $(-r, r)$  da yaqinlashuvchi va ularning yig'indilari  $S_1(x)$  va  $S_2(x)$  funksiyalar shu intervalda uzlusiz bo'ladi. Demak,

$$\lim_{x \rightarrow 0} S_1(x) = S_1(0), \quad \lim_{x \rightarrow 0} S_2(x) = S_2(0).$$

Yuqoridagi (14.35) shartga ko'ra  $S_1(0) = S_2(0)$  bo'ladi. Bundan esa  $a_0 = b_0$  ekanligi kelib chiqadi. Binoharin,  $\forall x \in (-r, r)$  uchun

$$\sum_{n=1}^{\infty} a_n x^n = \sum_{n=1}^{\infty} b_n x^n.$$

Agar  $x \neq 0$  desak, bu tenglikdan barcha  $x \in (-r, 0) \cup (0, r)$  uchun

$$\sum_{n=1}^{\infty} a_n x^{n-1} = \sum_{n=1}^{\infty} b_n x^{n-1}$$

ga ega bo'lamiz. Bu darajali qatorlarning har biri ham  $(-r, r)$  da yaqinlashuvchi bo'ladi va demak, ularning yig'indilari shu intervalda uzlusiz funksiya bo'ladi. Shu xususiyatdan foydalansak,  $x \rightarrow 0$  da

$$\lim_{x \rightarrow 0} \sum_{n=1}^{\infty} a_n x^{n-1} = a_1, \quad \lim_{x \rightarrow 0} \sum_{n=1}^{\infty} b_n x^{n-1} = b_1$$

bo'lishini va demak,  $a_1 = b_1$  ekanini topamiz. Bu jarayonni davom ettira borib, barcha  $n \in N$  uchun  $a_n = b_n$  bo'lishi topiladi. Demak, (14.20) va (14.34) darajali qatorlar bir xil. ▶

$(-r, r)$  ( $r > 0$ ) oraliqda  $f(x)$  funksiya berilgan va uzlusiz bo'linsin. Yuqoridagi teorema,  $f(x)$  ni darajali qator yig'indisi sifatida ifodalay olinsa, bunday ifodalash yagona bo'lishini bildiradi.

### 6-§. Taylor qatori

Biz yuqorida, har qanday darajali

$$\sum_{n=0}^{\infty} a_n x^n = a_0 + a_1 x + a_2 x^2 + \dots + a_n x^n + \dots$$

qator o'zining yaqinlashish intervali  $(-r, r)$  da uzlusiz  $S(x)$  funksiyani (darajali qator yig'indisini) ifodalab, hu funksiya shu oraliqda istalgan tartibdagi hosilaga ega bo'lishini ko'rdik.

Endi biror oraliqda istalgan tartibdag'i hosilaga ega bo'lgan funksiyani darajali qatorga yoyish masalasini qaraymiz.

**I<sup>6</sup>. Funksiyalarni Teylor qatoriga yoyish.**  $f(x)$  funksiya  $x = x_0$  nuqtaning biror

$$U_\delta(x_0) = \{x \in R : x_0 - \delta < x < x_0 + \delta\} (\delta > 0)$$

atrofida berilgan bo'lib, shu atrofda funksiya istalgan tartibdag'i hosilaga ega bo'lsin. Ravshanki, bu funksiyaning 1-qism. 6-bob, 7-§ da batafsil o'rGANILGAN Teylor formulasi

$$f(x) = f(x_0) + \frac{f'(x_0)}{1!}(x - x_0) + \frac{f''(x_0)}{2!}(x - x_0)^2 + \dots + \frac{f^{(n)}(x_0)}{n!}(x - x_0)^n + r_n(x)$$

ni yozish mumkin, bunda  $r_n(x)$  qoldiq had.

Berilgan  $f(x)$  funksiyaning  $x_0$  nuqtada istalgan tartibdag'i hosilaga ega bo'lishi Teylor formulasidagi hadlarning sonini har qancha katta olish imkonini beradi. Binobarin, tabiiy ravishda ushu

$$f(x_0) \cdot \frac{f'(x_0)}{1!}(x - x_0) + \frac{f''(x_0)}{2!}(x - x_0)^2 + \dots + \frac{f^{(n)}(x_0)}{n!}(x - x_0)^n. \quad (14.36)$$

qator yuzaga keladi. Bu maxsus darajali qator bo'lib, uning koeffisientlari  $f(x)$  funksiya va uning hosilalarining  $x_0$  nuqtadagi qiymatlari orqali ifodalanadi.

Odatda (14.36) darajali qator  $f(x)$  funksiyaning Teylor qatori deb ataladi.

Xususan,  $x_0 = 0$  da quyidagicha bo'ladi:

$$f(0) + \frac{f'(0)}{1!}x + \frac{f''(0)}{2!}x^2 + \dots + \frac{f^{(n)}(0)}{n!}x^n + \dots \quad (14.37)$$

Darajali qatorlar deb nomlangan 8-§ ning boshlanishida  $\sum_{n=0}^{\infty} a_n x^n$

ko'rinishdagi darajali qatorlarni o'rGANISHNI kelishib olingen edi. Shuni etiborga olib,  $f(x)$  funksiyaning (14.37) ko'rinishdagi Teylor qatorini o'rGANAMIZ.

Yana bir bor ta'kidlaymizki, (14.36) qator  $f(x)$  funksiya bilan o'zining koefisientlari orqali bog'langan bo'lib, bu (14.36) qator yaqinlashuvchi bo'ladimi, yaqinlashuvchi bo'lgan holda uning yig'indisi  $f(x)$  ga teng bo'ladimi, bundan qat'iy nazar, uni  $f(x)$  funksiyaning Teylor qatori deb atadik.

Tabiiy ravishda quyidagi savol tug'iladi: qachon biror  $U_\delta(0)$  oraliqda berilgan, istalgan tartibdag'i hosilaga ega bo'lgan  $f(x)$  funksiyaning Teylor qatori

$$\sum_{n=0}^{\infty} \frac{f^{(n)}(0)}{n!} x^n = f(0) + \frac{f'(0)}{1!}x + \frac{f''(0)}{2!}x^2 + \dots + \frac{f^{(n)}(0)}{n!}x^n +$$

shu oraliqda xuddi shu  $f(x)$  ga yaqinlashadi.

**22-teorema.**  $f(x)$  funksiya biror  $(-r, r)$  ( $r > 0$ ) oraliqda istalgan tartibdag'i hosilaga ega bo'lib, uning  $x = 0$  nuqtadagi Teylor qatori

$$f(0) + \frac{f'(0)}{1!}x + \frac{f''(0)}{2!}x^2 + \dots + \frac{f^{(n)}(0)}{n!}x^n.$$

bo'lsin.

Bu qator  $(-r, r)$  oraliqda  $f(x)$  ga yaqinlashishi uchun  $f(x)$  funksiya Teylor formulasi

$$f(x) = f(0) + \frac{f'(0)}{1!}x + \frac{f''(0)}{2!}x^2 + \dots + \frac{f^{(n)}(0)}{n!}x^n + r_n(x) \quad (14.38)$$

ning qoldiq hadi barcha  $x \in (-r, r)$  da nolga intilishi ( $\lim_{n \rightarrow \infty} r_n(x) = 0$ ) zarur va yetarli.

◀ **Zururligi.** Avvalo (14.37) qatorming koefisientlari bilan (14.38) Teylor formulasiidagi koefisientlarning bir xil ekanligini ta'kidlaymiz.

(14.37) qator yaqinlashuvchi bo'lib, uning yig'indisi  $f(x)$  ga teng bo'lisin. U holda bu qatorming qismiy yig'indisi

$$S_n(x) = f(0) + \frac{f'(0)}{1!}x + \frac{f''(0)}{2!}x^2 + \dots + \frac{f^{(n)}(0)}{n!}x^n$$

uchun

$$\lim_{n \rightarrow \infty} S_n(x) = f(x) \quad (\forall x \in (-r, r))$$

bo'ldi. Undan esa  $(\forall x \in (-r, r))$  uchun

$$\lim_{n \rightarrow \infty} [f(x) - S_n(x)] = \lim_{n \rightarrow \infty} r_n(x) = 0$$

bo'lishi kelib chiqadi.

**Yetarlilik.**  $\forall x \in (-r, r)$  da  $\lim_{n \rightarrow \infty} r_n(x) = 0$  bo'lisin. U holda quyidagicha  $\lim_{n \rightarrow \infty} [f(x) - S_n(x)] = 0$  bo'lib, undan esa

$$\lim_{n \rightarrow \infty} S_n(x) = f(x)$$

bo'lishi kelib chiqadi. Bu esa (14.37) qator  $(-r, r)$  da yaqinlashuvchi bo'lib, uning yig'indisi  $f(x)$  ga teng bo'lishini, ya'ni

$$f(x) = f(0) + \frac{f'(0)}{1!}x + \frac{f''(0)}{2!}x^2 + \dots + \frac{f^{(n)}(0)}{n!}x^n +$$

ekanligini bildiradi. ▶

Odatda keyingi munosabat o'rinni bo'lsa,  $f(x)$  funksiya Teylor qatoriga yoyilgan deb ataladi.

**23-teorema.** Agar  $f(x)$  funksiya  $(-r, r)$  oraliqda ( $r > 0$ ) darajali qatorga yoyilgan bo'lsa:

$$f(x) = a_0 + a_1x + a_2x^2 + \dots + a_nx^n + \dots \quad (14.39)$$

bu qator  $f(x)$  funksiyaning Teylor qatori bo'ldi.

◀ 20-teorema va uning natijasiga ko'ra (14.39) darajali qator  $(-r, r)$  oraliqda istalgan marta (hadma-had) differensiallanuvchi bo'lib,

$$f'(x) = 1 \cdot a_1 + 2 \cdot a_2x + 3 \cdot a_3x^2 + \dots + na_nx^{n-1} + \dots$$

$$f''(x) = 1 \cdot 2 \cdot a_2 + 2 \cdot 3 \cdot a_3x + \dots + n(n-1)a_nx^{n-2} + \dots$$

$$f'''(x) = 1 \cdot 2 \cdot 3 \cdot a_3 + \dots + n(n-1)(n-2)a_nx^{n-3} + \dots$$

$$f^{(n)}(x) = 1 \cdot 2 \cdot 3 \cdots (n-1)n a_n +$$

bo'ladi. Keyingi tengliklarda  $x = 0$  deh quyidagi larni topamiz:

$$a_0 = f(0), \quad a_1 = \frac{f'(0)}{1!}, \quad a_2 = \frac{f''(0)}{2!}, \quad a_3 = \frac{f'''(0)}{3!}, \quad a_n = \frac{f^{(n)}(0)}{n!}.$$

Natijada (14.39) qatorning ko'rinishi quyidagicha bo'ladi:

$$f(x) = f(0) + \frac{f'(0)}{1!}x + \frac{f''(0)}{2!}x^2 + \cdots + \frac{f^{(n)}(0)}{n!}x^n + \cdots$$

Quyida funksiyaning Teylor qatoriga yoyilishining yetarli shartini ifodalovchi teoremani keltiramiz.

**24-teorema.**  $f(x)$  funksiya biror  $(-r, r)$  oraliqda istalgan tartibdagi hosilaga ega bo'lsin. Agar shunday  $M > 0$  soni mavjud bo'lsaki, barcha  $\forall x \in (-r, r)$  hamda barcha  $n = 0, 1, 2, \dots$  uchun

$$|f^{(n)}(x)| \leq M \quad (f_{(x)}^{(0)} = f(x))$$

tengsizlik bajarilsa, u holda  $(-r, r)$  oraliqda  $f(x)$  funksiya Teylor qatoriga yoyiladi, ya'ni

$$f(x) = \sum_{n=0}^{\infty} \frac{f^{(n)}(0)}{n!} x^n = f(0) + \frac{f'(0)}{1!}x + \frac{f''(0)}{2!}x^2 + \cdots$$

bo'ladi.

◀  $f(x)$  funksiya uchun Teylor formulasi

$$f(x) = f(0) + \frac{f'(0)}{1!}x + \frac{f''(0)}{2!}x^2 + \cdots + \frac{f^{(n)}(0)}{n!}x^n + r_n(x)$$

ni yozib, uning Langraj ko'rinishidagi qoldiq hadi

$$r_n(x) = \frac{f^{(n+1)}(\theta x)}{(n+1)} x^{n+1} \quad (0 < \theta < 1)$$

ni olaylik. U holda

$$|r_n(x)| = \left| \frac{f^{(n+1)}(\theta x)}{(n+1)} x^{n+1} \right| \leq M \frac{x^{n+1}}{(n+1)} \quad (x \in (-r, r))$$

bo'ladi. Agar

$$\lim_{x \rightarrow 0} \frac{r^{n+1}}{(n+1)} = 0$$

bo'lishini etiborga olsak, u holda

$$\lim_{n \rightarrow \infty} r_n(x) = 0 \quad (x \in (-r, r))$$

ekanligini aniqlaymiz. Bu esa (14.39) munosabatning o'rinni bo'lishini bildiradi. ▶

## 2<sup>º</sup>. Elementar funksiyalarning Teylor qatorlari.

1)  $f(x) = e^x$  funksiyaning Teylor qatori. Ma'lumki,  $f(x) = e^x$  funksiyaning (ixtiyoriy chekli  $[-a, a]$  ( $a > 0$ ) oraliqdagi) Teylor formulasi

$$e^x = 1 + \frac{x}{1!} + \frac{x^2}{2!} + \cdots + \frac{x^n}{n!} + r_n(x)$$

bo'lib, uning qoldiq hadi esa Langranj ko'rinishida quyidagicha bo'ladi:

$$r_n(x) = \frac{x^n}{(n+1)!} e^{\theta x} \quad (0 < \theta < 1)$$

(qarang, 1-qism, 6-bob, 7-§). Har bir  $x \in [-a, a]$  ( $a > 0$ ) da  $e^{\theta x} < e^x$  bo'lishini etiborga olsak, unda

$$|r_n(x)| < \frac{a^{n+1}}{(n+1)!} e^x$$

ekanligi kelib chiqadi va  $n \rightarrow \infty$  da u nolga intiladi. Demak, ixtiyoriy chekli  $x$  da

$$e^x = \sum_{n=0}^{\infty} \frac{x^n}{n!} = 1 + \frac{x}{1!} + \frac{x^2}{2!} + \dots + \frac{x^n}{n!} + \dots$$

bo'ldi.

2)  $f(x) = \sin x$  funksiyaning Teylor qatori. Ma'lumki,  $f(x) = \sin x$  funksiyaning (ixtiyoriy chekli  $[-a, a]$  ( $a > 0$ ) oraliqdagi) Teylor formulasi

$$\sin x = x - \frac{x^3}{3!} + \frac{x^5}{5!} + \dots + (-1)^{n-1} \frac{x^{2n-1}}{(2n-1)!} + r_{2n}(x)$$

bo'ldi. Bu formula qoldiq hadining Lagranj ko'rinishidan foydalanim, (qaralsin, 1-qism, 6-bob, 7-§)  $\forall x \in [-a, a]$  ( $a > 0$ ) uchun

$$|r_{2n}(x)| < \frac{a^{2n+1}}{(2n+1)!}$$

bo'lishini topamiz. Undan

$$\lim_{n \rightarrow \infty} r_{2n}(x) = 0$$

bo'lishi kelib chiqadi. Demak,  $\forall x$  uchun

$$\sin x = \sum_{n=0}^{\infty} (-1)^n \frac{x^{2n-1}}{(2n-1)!} = x - \frac{x^3}{3!} + \frac{x^5}{5!} + \dots + (-1)^{n-1} \frac{x^{2n-1}}{(2n-1)!} + \dots$$

bo'ldi.

3)  $f(x) = \cos x$  funksiyaning Teylor qatori. Bu funksiyaning Teylor formulasi

$$\cos x = 1 - \frac{x^2}{2!} + \frac{x^4}{4!} + \dots + (-1)^n \frac{x^{2n}}{(2n)!} + r_{2n}(x)$$

qoldiq hadining Lagranj ko'rinishidan foydalanim (qaralsin, 1-qism, 6-bob, 7-§)  $\forall x \in [-a, a]$  ( $a > 0$ ) uchun

$$|r_{2n}(x)| < \frac{a^{2n+2}}{(2n+2)!}$$

bo'lishini topamiz. Undan

$$\lim_{n \rightarrow \infty} r_{2n}(x) = 0$$

bo'lishi kelib chiqadi. Demak,  $\forall x$  uchun

$$\cos x = \sum_{n=0}^{\infty} (-1)^n \frac{x^{2n}}{(2n)!} = 1 - \frac{x^2}{2!} + \frac{x^4}{4!} + \dots + (-1)^n \frac{x^{2n}}{(2n)!} + \dots$$

4)  $f(x) = \ln(1+x)$  funksiyaning Teylor qatori. Ma'lumki, bu funksiyaning Teylor formulasi quyidagicha bo'ldi:

$$\ln(1+x) = x - \frac{x^2}{2} + \frac{x^3}{3} - \frac{x^4}{4} + \dots + (-1)^{n-1} \frac{x^n}{n} + r_n(x).$$

Bu formulada  $x \in [0, 1]$  da  $r_n(x)$  qoldiq hadni Lagranj ko'rinishida quyidagicha yozib

$$r_n(x) = \frac{(-1)^n x^{n+1}}{(n+1)(1+\theta x)^{n+1}}, \quad (0 < \theta < 1)$$

uning uchun

$$|r_n(x)| \leq \frac{1}{n+1} \quad (14.40)$$

bo'l shini,  $x \in [-a, 0]$  ( $0 < a < 1$ ) bo'lganda esa  $r_n(x)$  qoldiq hadni Koshi ko'rinishida quyidagicha yozib

$$r_n(x) = (-1)^n x^{n+1} \frac{(1-\theta_1)^n}{(1+\theta_1 x)^{n+1}}, \quad (0 < \theta < 1)$$

uning uchun

$$|r_n(x)| \leq \frac{a^{n+1}}{1-a} \quad (14.41)$$

bo'l shini ko'rgan edik (1-qism, 6-bob, 7-§).

(14.40) va (14.41) munosabatlardan  $\lim_{n \rightarrow \infty} r_n(x) = 0$  bo'l shini topamiz. Demak,

$\forall x \in (-1, 1]$  da

$$\ln(1+x) = \sum_{n=1}^{\infty} (-1)^{n-1} \frac{x^n}{n} = x - \frac{x^2}{2} + \frac{x^3}{3} + \dots + (-1)^{n-1} \frac{x^n}{n} + \dots$$

bo'ladi.

SHuni ta'kidlash lozimki,  $\ln(1+x)$  funksiya  $(-1, +\infty)$  oraliqda berilgan bo'lsha ham bu funksiyaning Teylor qatori  $(-1, +1]$  yarim intervalda o'rinnlidir.

5)  $f(x) = (1+x)^\alpha$  funksiyaning Teylor qatori. Bu funksiyaning Teylor formulasi

$$(1+x)^\alpha = 1 + \frac{\alpha}{1!} x - \frac{\alpha(\alpha-1)}{2!} x^2 + \dots + \frac{\alpha(\alpha-1) \dots (\alpha-n+1)}{n!} x^n + r_n(x)$$

bo'llib (qaralsin 1-qism, 6-bob, 7-§), uning qoldiq hadi Koshi ko'rinishida quyidagicha bo'ladi:

$$r_n(x) = \frac{\alpha(\alpha-1) \dots (\alpha-n)}{n!} (1+\theta x)^{\alpha-1} (1-\theta)^n x^{n+1}, \quad (0 < \theta < 1).$$

Uni ushbu

$$r_n(x) = \frac{(\alpha-1)(\alpha-2) \dots [(\alpha-1)-(n-1)]}{n!} x^n \alpha x (1+\theta x)^{\alpha-1} \left( \frac{1-\theta}{1+\theta x} \right)^n$$

ko'rinishida yozib olamiz.

Aytaylik  $-1 < x < 1$  bo'l sin. Unda birinchidan,

$$\lim_{n \rightarrow \infty} \frac{1}{n!} (\alpha-1)(\alpha-2) \dots [(\alpha-1)-(n-1)] x^n = 0,$$

chunki bu yaqinlashuvchi

$$1 + \sum_{n=1}^{\infty} \frac{\alpha(\alpha-1) \dots (\alpha-n+1)}{n!} x^n.$$

qatorning umumiy hadi (bu qatorning yaqinlashuvchiligi Dalamber alomatiga ko'ra ko'rsatiladi), ikkinchidan,  $|\alpha x|(1-|x|)^{a-1} < \alpha x(1+\theta x)^{a-1} < |\alpha x|(1+|x|)^{a-1}$  va nihoyat, uchinchidan  $\left| \frac{1-\theta}{1+\theta x} \right|^n \leq \left| \frac{1-\theta}{1+\theta x} \right| < 1$  bo'lganligidan  $\lim_{n \rightarrow \infty} r_n(x) = 0$  bo'lishi kelib chiqadi. Demak,  $|x| < 1$  da

$$(1+x)^a = 1 + \frac{\alpha(a-1)}{2!} x^2 + \dots + \frac{\alpha(\alpha-1)\dots(\alpha-n+1)}{n!} x^n + \dots$$

bo'ladi.

### Mashqlar

#### 14.12. Ushbu

$$f_n(x) = \ln \left( 3 + \frac{n^2 e^x}{e^{2x}} \right) \quad (n = 1, 2, 3, \dots)$$

funksional ketma-ketlikning  $[0, +\infty)$  da limit funksiyasi topilsin va unga notejis yaqinlashishi isbotlansin.

**14.13.** Agar  $\{f_n(x)\}$  va  $\{g_n(x)\}$  funksional ketma-ketliklar  $M \subset R$  to'plamda mos ravishda  $f(x)$  va  $g(x)$  funksiyalarga tekis yaqinlashuvchi bo'lsa,

$$[\alpha f_n(x) + \beta g_n(x)] \quad (\alpha \in R, \beta \in R)$$

funksional ketma-ketlik  $M$  to'plamda  $\alpha f(x) + \beta g(x)$  funksiyaga tekis yaqinlashishi isbotlansin.

#### 14.14. Ushbu $[0, 1]$ da berilgan

$$f_n(x) = \begin{cases} 0, \text{ agar } x = 0 \text{ va } \frac{1}{n} \leq x \leq 1 \text{ bo'lsa}, \\ 1, \text{ agar } x = \frac{1}{2n} \text{ bo'lsa}. \\ \text{chiziqli funksiya, agar } 0 < x \leq \frac{1}{2n}, \frac{1}{2n} \leq x \leq \frac{1}{n} \end{cases}$$

funksional ketma-ketlikning limit funksiyasi  $f(x) = 0$  ga  $[0, 1]$  da notejis yaqinlashishi ko'rsatilsin.

#### 14.15. Agar ushbu

$$\sum_{n=1}^{\infty} u_n(x)$$

funksional qator  $M \subset R$  to'plamda tekis yaqinlashuvchi bo'lsa,  
 $\{u_n(x)\}$  ( $n = 1, 2, 3, \dots$ )

funksional ketma-ketlik  $M$  to'plamda  $f(x) = 0$  funksiyaga tekis yaqinlashishi ishotlansin.

#### 14.16. Ushbu

$$\sum_{n=1}^{\infty} (n+1)x^n \quad (-1 < x < 1)$$

funksional qator yig'indisi topilsin.

**14.17. Aytaylik,**

$\{a_n\}$  ( $n = 0, 1, 2, 3, \dots$ ,  $a_n \neq 0$ )  
sonlar ketma-ketligi uchun

$$\lim_{n \rightarrow \infty} \left| \frac{a_n}{a_{n+1}} \right|$$

limit mavjud bo'lsin. U holda

$$\sum_{n=0}^{\infty} a_n x^n$$

darajali qatorming yaqinlashish radiusi

$$r = \lim_{n \rightarrow \infty} \left| \frac{a_n}{a_{n+1}} \right|$$

bo'lishi isbotlansin.

### Xosmas integrallar

Mazkur kursning 9. 10- boblarida funksiyaning aniq integrali (Riman integrali) tushunchasi kiritilib, u batasil o'rganildi. Integral bayonida integrallash oralig'ining chekliligi va funksiyaning chegaralanganligi bevosita ishtirok etdi.

Endi aniq integral tushunchasini:

1) cheksiz oraliqda aniqlangan funksiyalarga;

2) chegaralanmagan funksiyalarga

nisbatan umumlashtirilishini qaraymiz. Odatda, bunday integrallar xosmas interallar deyiladi.

#### I.-§. Cheksiz oraliq bo'yicha xosmas integrallar

*1°. Cheksiz oraliq bo'yicha xosmas integral tushunchasi.*  $f(x)$  funksiya  $[a, +\infty)$  oraliqda berilgan bo'lib, uning istalgan  $[a, t]$  qismida integrallanuvchi bo'lisin ( $a \in R$ ,  $t \in R$ ,  $t \geq a$ ). Ravshanki,

$$\int_a^t f(x) dx$$

integral  $t$  o'zgaruvchiga bog'liq bo'ladi:

$$F(t) = \int_a^t f(x) dx.$$

*I-ta'rif.* Agar  $t \rightarrow +\infty$  da  $F(t)$  funksiyaning limiti mavjud bo'lsa, bu limit  $f(x)$  funksiyaning  $[a, +\infty)$  oraliq bo'yicha xosmas integrali deyiladi va

$$\int_a^\infty f(x) dx \quad (15.1)$$

kabi belgilanadi:

$$\int_a^\infty f(x) dx = \lim_{t \rightarrow +\infty} F(t) = \lim_{t \rightarrow +\infty} \int_a^t f(x) dx.$$

Agar  $t \rightarrow +\infty$  da  $F(t)$  funksiyaning limiti mavjud va chekti bo'lsa, (15.1) xosmas integral yaqinlashuvchi deyiladi.

Agar  $t \rightarrow +\infty$  da  $F(t)$  funksiyaning limiti cheksiz yoki  $F(t)$  funksiyaning limiti mavjud bo'lmasa, (15.1) xosmas integral uzoqlashuvchi deyiladi.

Masalan, ushbu

$$\int_0^\infty e^{-x} dx$$

xosmas integral yaqinlashuvchi bo'ladi, chunki

$$\lim_{t \rightarrow +\infty} \int_0^t e^{-x} dx = \lim_{t \rightarrow +\infty} (-e^{-t} + 1) = 1$$

va demak,

$$\int_0^{\infty} e^{-x} dx = 1.$$

Funksiyaning  $(-\infty, a]$  va  $(-\infty, +\infty)$  oraliqlar bo'yicha xosmas integrallari va ularning yaqinlashuvchiligi (uzoqlashuvchiligi) yuqoridagi kabi ta'riflanadi:

$$\begin{aligned}\int_{-\infty}^a f(x) dx &= \lim_{t \rightarrow -\infty} \int_t^a f(x) dx, \\ \int_{-\infty}^{\infty} f(x) dx &= \lim_{t \rightarrow -\infty} \int_t^{\infty} f(x) dx.\end{aligned}$$

Masalan. ushbu

$$\int_{-\infty}^0 \frac{dx}{1+x^2}$$

xosmas integral yaqinlashuvchi bo'ladi, chunki

$$\lim_{t \rightarrow -\infty} \int_t^0 \frac{1}{1+x^2} dx = \lim_{t \rightarrow -\infty} \left( -\arctan t \right) = \frac{\pi}{2}$$

va demak,

$$\int_{-\infty}^0 \frac{1}{1+x^2} dx = \frac{\pi}{2}.$$

Shunday qilib, xosmas integrallar avval o'r ganilgan integraldan limitga o'tish amali orqali yuzaga kelar ekan.

**15.1-misol.** Ushbu

$$\int_a^{\infty} \frac{dx}{x^\alpha} \quad (a > 0, \alpha > 0)$$

xosmas integral yaqinlashuvchilikka tekshirilsin.

◀ Ta'rifga ko'ra

$$\int_a^{+\infty} \frac{dx}{x^\alpha} = \lim_{t \rightarrow +\infty} \int_a^t \frac{dx}{x^\alpha}.$$

Aytaylik,  $\alpha < 1$  va  $\alpha = 1$  bo'lsin. Bu holda, mos ravishda

$$\lim_{t \rightarrow +\infty} \int_a^t \frac{dx}{x^\alpha} = \lim_{t \rightarrow +\infty} \frac{1}{1-\alpha} (t^{1-\alpha} - a^{1-\alpha}) = +\infty.$$

$$\lim_{t \rightarrow +\infty} \int_a^t \frac{dx}{x} = \lim_{t \rightarrow +\infty} (\ln t - \ln a) = +\infty$$

bo'ladi.

Aytaylik,  $\alpha > 1$  bo'lsin. Bu holda

$$\lim_{t \rightarrow +\infty} \int_a^t \frac{dx}{x} = \lim_{t \rightarrow +\infty} \left[ \frac{t^{-\alpha+1}}{-\alpha+1} - \frac{a^{-\alpha+1}}{-\alpha+1} \right] = \frac{a^{1-\alpha}}{\alpha-1}$$

bo'ladi.

Shunday qilib

$$\int_a^{\infty} \frac{dx}{x^{\alpha}} \quad (\alpha > 0, \alpha \neq 1)$$

xosmas integral  $\alpha > 1$  bo'lganda yaqinlashuvchi,  $\alpha \leq 1$  bo'lganda uzoqlashuvchi bo'ladi. ►

Biz quyida, asosan,  $f(x)$  funksiyaning  $[a, +\infty)$  oraliq bo'yicha  $\int f(x)dx$  xosmas integralini o'rghanamiz.  $(-\infty, a]$  va  $(-\infty, +\infty)$  oraliqlar bo'yicha xosmas integrallar tegishlicha bayon etilishi mumkin.

**2<sup>o</sup>. Xosmas integralarning yaqinlashuvchiligi. Integralning absalyut yaqinlashuvchiligi.** Xosmas integralarning yaqinlashuvchiligi shartlarini keltiramiz.

Faraz qilaylik,  $f(x)$  funksiya  $[a, +\infty)$  oraliqda berilgan bo'lib,  $\forall x \in [a, +\infty)$  da

$$f(x) \geq 0$$

bo'lisin. U holda  $\forall t_1, t_2 \in (a, +\infty)$  uchun  $t_1 < t_2$  bo'lganda

$$F(t_2) = \int_a^{t_2} f(x)dx = \int_a^{t_1} f(x)dx + \int_{t_1}^{t_2} f(x)dx = F(t_1) + \int_{t_1}^{t_2} f(x)dx \geq F(t_1)$$

Demak,

$$F(t) = \int_a^t f(x)dx$$

funksiya  $[a, +\infty)$  da o'suvchi bo'ladi.

**I-teorema.**  $f(x)$  funksiya  $[a, +\infty)$  oraliqda berilgan bo'lib,  $\forall x \in [a, +\infty)$  da

$$f(x) \geq 0$$

bo'lisin. Bu funksiyaning  $[a, +\infty)$  oraliq bo'yicha xosmas integrali

$$\int_a^{\infty} f(x)dx$$

ning yaqinlashuvchi bo'lishi uchun,

$$F(t) = \int_a^t f(x)dx$$

funksiyaning yuqoridan chegaralangan, ya'ni

$$\exists C \in R, \quad \forall t \in [a, +\infty): \int_a^t f(x)dx \leq C$$

bo'lishi zarur va yetarli.

◀ **Zarurligi.** Aytaylik, xosmas integral

$$\int_a^{\infty} f(x)dx$$

yaqinlashuvchi bo'lisin. U holda

$$\lim_{t \rightarrow +\infty} F(t) = \lim_{t \rightarrow +\infty} \int_a^t f(x)dx = J$$

mavjud va chekli bo'lib.

$$J = \sup_{x \in [a, +\infty)} F(x)$$

bo'ladi. Aniq yuqori chegaraning ta'rifiga ko'ra,  $\forall t \in [a, +\infty)$  da

$$F(t) = \int_a^t f(x)dx \leq \int_a^{+\infty} f(x)dx$$

ya'ni

$$F(t) = \int_a^t f(x)dx \leq C$$

bo'ladi.

*Yetarlilik.* Aytaylik,

$$\exists C \in \mathbb{R}, \quad \forall t \in [a, +\infty): \int_a^t f(x)dx \leq C$$

bo'lsin. Unda monoton funksiyaning limiti haqidagi teoremagaga ko'ra ushbu

$$\lim_{t \rightarrow +\infty} F(t)$$

limit mavjud va chekli bo'ladi. Demak,  $\int_a^{+\infty} f(x)dx$  xosmas integral yaqinlashuvchi. ▶

*Eslatma.* Agar  $\forall x \in [a, +\infty)$  da  $f(x) \geq 0$  bo'lib.

$$F(t) = \int_a^t f(x)dx$$

funksiya yuqorida chegaralanmagan bo'lsa,  $\int_a^{+\infty} f(x)dx$  xosmas integral uzoqlashuvchi bo'ladi.

*2-teorema.* Faraz qilaylik,  $f(x)$  va  $g(x)$  funksiyalari  $[a, +\infty)$  oraliqda berilgan bo'lib,  $\forall x \in [a, +\infty)$  da

$$0 \leq f(x) \leq g(x)$$

bo'lsin.

Agar  $\int_a^{+\infty} g(x)dx$  xosmas integral yaqinlashuvchi bo'lsa,  $\int_a^{+\infty} f(x)dx$  xosmas integral ham yaqinlashuvchi bo'ladi.

Agar  $\int_a^{+\infty} f(x)dx$  xosmas integral uzoqlashuvchi bo'lsa,  $\int_a^{+\infty} g(x)dx$  ham uzoqlashuvchi bo'ladi.

◀ Aytaylik,  $\int_a^{+\infty} g(x)dx$  xosmas integral yaqinlashuvchi bo'lsin. Ravshanki,

$$\int_a^b f(x)dx \leq \int_a^b g(x)dx \leq \int_a^b h(x)dx$$

bo'ladi. Bundan  $\int_a^b f(x)dx$  ning yuqoridan chegaralanganligi kelib chiqadi. 1-teoremaga ko'ra

$$\int_a^b f(x)dx$$

xosmas integral yaqinlashuvchi bo'ladi.

Aytaylik,  $\int_a^b f(x)dx$  xosmas integral uzoqlashuvchi bo'lsin. U holda

$$F(t) = \int_a^t f(x)dx$$

funksiya yuqoridan chegaralanmagan bo'lib.

$$\int_a^b f(x)dx < \int_a^b g(x)dx$$

tengsizlikka ko'ra

$$\int_a^b g(x)dx$$

funksiya ham yuqoridan chegaralanmagan bo'ladi. Yuqorida keltirilgan eslatmaga binoan  $\int_a^b g(x)dx$  xosmas integral uzoqlashuvchi bo'ladi. ▶

### 15.2-misol. Ushbu

$$\int_1^\infty \frac{\cos^4 3x}{\sqrt[3]{1+x^6}} dx$$

xosmas integral yaqinlashuvchilikka tekshirilsin.

◀ Ravshanki, integral ostidagi funksiya

$$f(x) = \frac{\cos^4 3x}{\sqrt[3]{1+x^6}} \geq 0$$

bo'ladi. Ayni paytda  $x \geq 1$  bo'lganda

$$f(x) = \frac{\cos^4 3x}{\sqrt[3]{1+x^6}} \leq \frac{1}{\sqrt[3]{1+1^6}} = \frac{1}{\sqrt[3]{2}}$$

tengsizlik bajariladi. Quyidagi

$$\int_1^\infty \frac{dx}{x^{\frac{1}{3}}}$$

xosmas integral yaqinlashuvchi (qaralsin, 15.1-misol) bo'lganligi uchun 2-teoremaga ko'ra berilgan xosmas integral yaqinlashuvchi bo'ladi. ▶

Endi  $[a, +\infty)$  oraliqda berilgan ixtiyoriy  $f(x)$  funksiya xosmas integrali

$$\int f(x)dx$$

ning yaqinlashuvchiligi haqidagi teoremani keltiramiz.

**3-teorema. (Koshi teoremasi).** Ushbu

$$\int f(x)dx$$

xosmas integral yaqinlashuvchi bo'lishi uchun

$$\forall \varepsilon > 0. \exists t_0 > a. \forall t' > t_0. \forall t'' > t_0$$

bo'lganda

$$\left| \int_t^{t''} f(x)dx \right| < \varepsilon$$

tengsizlikning bajarilishi zarur va yetarli.

◀ Ma'lumki,

$$\int f(x)dx$$

xosmas integralning yaqinlashuvchiligi  $t \rightarrow +\infty$  da

$$F(t) = \int f(x)dx$$

funksiyaning chekli limitga ega bo'lishidan iborat.

Funksiyaning chekli limitga ega bo'lishi haqidagi Koshi teoremasiga (qaralsin, 4-bob. 6-§) binoan,

$$\forall \varepsilon > 0. \exists t_0 > a. \forall t' > t_0. \forall t'' > t_0 : |F(t'') - F(t')| < \varepsilon$$

ya'ni

$$|F(t'') - F(t')| = \left| \int_t^{t''} f(x)dx - \int_t^{t'} f(x)dx \right| = \left| \int_{t'}^{t''} f(x)dx \right| < \varepsilon$$

bo'lishi zarur va yetarli edi. ▶

Bu nazariy ahamiyatga ega bo'lgan muhim teorema bo'lib, undan xosmas integrallarning yaqinlashuvchanligini aniqlashda foydalanish ko'pincha qiyin bo'ladi.

Xosmas integrallarning yaqinlashuvchanligini aniqlashda ko'p qo'llaniladigan alomatlardan birini keltiramiz.

**4-teorema. (Dirixle atomati).**  $f(x)$  va  $g(x)$  funksiyalar  $(a, +\infty)$  oraliqda berilgan bo'lib, ular quyidagi shartlarni bajarsin:

1)  $f(x)$  funksiya  $(a, +\infty)$  oraliqda uzliksiz va uning shu oraliqdagi boshlang'ichi  $F(x)$  ( $F'(x) = f(x)$ ) funksiyasi chegaralangan;

2)  $g(x)$  funksiya  $(a, +\infty)$  oraliqda  $g'(x)$  hosisiga ega va u uzliksiz funksiya;

3)  $g(x)$  funksiya  $(a, +\infty)$  oraliqda kamayuvchi;

4)  $\lim_{t \rightarrow +\infty} g(t) = 0$ . U holda  $\int_a^t f(x)g(x)dx$  integral yaqinlashuvchi bo'ladi.

► Uzluksiz  $f(x)$  va  $g(x)$  funksiyalarning ko'paytmasi  $f(x)g(x)$  funksiya ham  $(a, +\infty)$  oraliqda uzluksiz bo'lgani uchun, bu  $f(x)g(x)$  funksiya istalgan  $[a, t]$  oraliqda integrallanuvchi bo'ladi, ya'nini

$$\varphi(t) = \int_a^t f(x)g(x)dx \quad (15.2)$$

integral mavjud.

$t \rightarrow +\infty$  da  $\varphi(t)$  funksiyaning chekli limitga ega bo'lishini ko'rsatamiz. Teoremaning 1- va 2- shartlaridan foydalabimiz. (15.2) integralni bo'laklab hisoblaymiz.

$$\int_a^t f(x)g(x)dx = \int_a^t g(x)dF(x) = g(x)dF(x)' - \int_a^t F(x)g'(x)dx. \quad (15.3)$$

O'ng tomondagi birinchi qo'shiluvchi uchun ushbu

$$|g(t)F(t)| < Mg(t) \quad (M = \sup |F(t)| < +\infty)$$

tengsizlikka ega bo'lamiz. Undan,  $t \rightarrow +\infty$  da  $g(t) \rightarrow 0$  bo'lishini e'tiborga olsak,

$$\lim_{t \rightarrow +\infty} g(t)F(t) = 0$$

bo'lishi kelib chiqadi.

Endi o'ng tomondagi ikkinchi  $\int_a^t F(x)g'(x)dx$  hadni qaraymiz. Modomiki,  $g(x)$  funksiya  $(a, +\infty)$  oraliqda uzluksiz differentiallanuvchi hamda shu oraliqda kamayuvchi ekan. unda  $\forall x \in (a, +\infty)$  da  $g'(x) \leq 0$  bo'lib,

$$\int_a^t F(x)g'(x)dx \leq M \int_a^t |g'(x)|dx = -M \int_a^t g'(x)dx = M[g(a) - g(t)] < Mg(a) \\ (g(t) \geq 0)$$

bo'ladi. Shunday qilib,  $t$  o'zgaruvchining barcha  $t > a$  qiymatlarida

$$\int_a^t F(x)g'(x)dx$$

integral ( $t$  o'zgaruvchining funksiyasi) yuqoridan chegaralangan. U holda 1-teoremaga ko'ra  $\int_a^t F(x)g'(x)dx$  integral yaqinlashuvchi bo'ladi. Demak,

$$\lim_{t \rightarrow +\infty} \int_a^t F(x)g'(x)dx$$

limit mavjud va chekli.

Yuqoridagi (15.3) tenglikda  $t \rightarrow +\infty$  da limitga o'tib, Ushbu

$$\lim_{t \rightarrow +\infty} \int_a^t f(x)g(x)dx$$

limitning mavjud hamda chekli bo'lishini topamiz. Bu esa  $\int f(x)g(x)dx$  integralning yaqinlashuvchiligidini bildiradi.

### 15.3-misol Ushbu

$$\int \frac{\sin x}{x^\alpha} dx \quad (\alpha > 0)$$

integral yaqinlashuvchilikka tekshirilsin.

◀ Bu integraldagi  $f(x) = \sin x$ ,  $g(x) = \frac{1}{x^\alpha}$  ( $\alpha > 0$ ) funksiyalar yuqorida keltirilgan tooremaning barcha shartlarini qanoatlantiradi:

1)  $f(x) = \sin x$  funksiya  $[1, +\infty)$  oraliqda uzliksiz va boshlang'ich funksiyasi  $F(x) = -\cos x$  chegaralangan;

2)  $g(x) = \frac{1}{x^\alpha}$  funksiya  $[1, +\infty)$  oraliqda  $g'(x) = -\frac{\alpha}{x^{1+\alpha}}$  hosilaga ega va u uzliksiz;

3)  $g(x) = \frac{1}{x^\alpha}$  ( $\alpha > 0$ ) funksiya  $[1, +\infty)$  oraliqda kamayuvchi;

4)  $\lim_{x \rightarrow +\infty} g(x) = \lim_{x \rightarrow +\infty} \frac{1}{x^\alpha} = 0$  ( $\alpha > 0$ ) bo'ladi. Demak, Dirixle alomatiga ko'ra berilgan integral yaqinlashuvchi. ▶

$f(x)$  funksiyaning xosmas integrali  $\int f(x)dx$  bilan bir qatorda

$$\int_1^{\infty} f(x)dx$$

xosmas integralni qaraymiz.

**5-teorema.** Agar  $\int f(x)dx$  integral yaqinlashuvchi bo'lsa, u holda  $\int f(x)dx$  integrali ham yaqinlashuvchi bo'ladi.

◀ Shartga ko'ra  $\int f(x)dx$  integral yaqinlashuvchi. 4-teoremaga asosan,  $\forall \varepsilon > 0$  olinganda ham, shunday  $t_0$  ( $t_0 > a$ ) topiladiki,  $t' > t_0$ ,  $t'' > t_0$  bo'lganda  $\left| \int f(x)dx \right| < \varepsilon$  tengsizlik bajariladi.

Agar

$$\left| \int_{t'}^{t''} f(x)dx \right| \leq \int_{t'}^{t''} |f(x)|dx$$

tengsizlikni e'tiborga olsak, u holda

$$\left| \int f(x)dx \right| < \varepsilon$$

bo'lishini topamiz.

Shunday qilib,  $\forall \varepsilon > 0$  son olinganda ham, shunday  $t_0$  ( $t_0 > a$ ) topiladiki,  $t' > t_0$ ,  $t'' > t_0$  bo'lгanda

$$\left| \int_a^t f(x)dx \right| < \varepsilon$$

bo'ladi. Bundan 4-teoremaga asosan  $\int_a^{\infty} f(x)dx$  integralning yaqinlashuvchiligini topamiz. ►

**2-ta'rif.** Agar  $\int_a^{\infty} f(x)dx$  integral yaqinlashuvchi bo'lsa,  $\int_a^{\infty} f(x)dx$  absolyut yaqinlashuvchi integral deb ataladi,  $f(x)$  funksiya esa  $[a, +\infty)$  oraliqda absolyut integrallanuvchi funksiya deyiladi.

**3-ta'rif.** Agar  $\int_a^{\infty} f(x)dx$  integral yaqinlashuvchi bo'lib,  $\int_a^{\infty} f(x)dx$  integral uzoqlashuvchi bo'lsa,  $\int_a^{\infty} f(x)dx$  shartli yaqinlashuvchi integral deyiladi.

Shunday qilib,  $\int_a^{\infty} f(x)dx$  xosmas integralni yaqinlashuvchilikka tekshirish quyidagi tartibda olib borilishi mumkin:

$\forall x \in [a, +\infty)$  da  $f(x) \geq 0$  bo'lsin. Bu holda  $\int_a^{\infty} f(x)dx$  integralning yaqinlashuvchi (uzoqlashuvchi) ligini yuqorida keltirilgan alomatlardan foydalanib topish mumkin. Boshqa hollarda  $f(x)$  funksianing  $|f(x)|$  absolyut qiymatining  $[a, +\infty)$  oraliq bo'yicha  $\int_a^{\infty} |f(x)|dx$  integralini qaraymiz. Ravshanki, keyingi integralga nisbatan yana yuqoridagi alomatlarni qo'llash mumkin. Agar biror alomatga ko'ra  $\int_a^{\infty} f(x)dx$  integralining yaqinlashuvchiligi topilsa, unda 5-teoremaga ko'ra berilgan  $\int_a^{\infty} f(x)dx$  integralning ham yaqinlashuvchiligi (hatto absolyut yaqinlashuvchiligi) topilgan bo'ladi.

Agar biror alomatga ko'ra  $\int_a^{\infty} f(x)dx$  integralining uzoqlashuvchiligini aniqlasak, aytish mumkinki,  $\int_a^{\infty} f(x)dx$  yoki uzoqlashuvchi bo'ladi yoki shartli yaqinlashuvchi bo'ladi va buni aniqlash qo'shimcha tahlil qilishni talab etadi.

**3°. Yaqinlashuvchi xosmas integralarning xossalari.** Riman integralini umumilashtirishdan hosil qilingan yaqinlashuvchi xosmas integrallar ham shu Rimant integrali xossalari singari xossalarga ega.

$f(x)$  funksiya  $[a, +\infty)$  oraliqda berilgan bo'lsin.

I) Agar  $f(x)$  funksiyaning  $[a, +\infty)$  oraliq bo'yicha  $\int_a^{\infty} f(x)dx$  integrali yaqinlashuvchi bo'lsa, bu funksiyaning  $[a, +\infty)$ ,  $(a < b)$  oraliq bo'yicha  $\int_a^b f(x)dx$  integrali ham yaqinlashuvchi bo'ladi va aksincha. Bunda

$$\int_a^b f(x)dx = \int_a^b f(x)dx + \int_b^{\infty} f(x)dx \quad (15.4)$$

bo'ladi.

◀ Aniq integral xossasiga ko'ra

$$\int_a^b f(x)dx = \int_a^t f(x)dx + \int_t^b f(x)dx \quad (a < t < \infty) \quad (15.5)$$

bo'ladi.  $\int_a^{\infty} f(x)dx$  integral yaqinlashuvchi, ya'ni

$$\int_a^{\infty} f(x)dx = \lim_{t \rightarrow +\infty} \int_a^t f(x)dx$$

limit mavjud va chekli bo'lsin. Yuqoridagi (15.5) munosabatni ushbu

$$\int_a^b f(x)dx = \int_a^t f(x)dx + \int_t^b f(x)dx$$

ko'rinishda yozib,  $t \rightarrow +\infty$  da limitga o'tib quyidagini topamiz:

$$\lim_{t \rightarrow +\infty} \int_a^b f(x)dx = \lim_{t \rightarrow +\infty} \int_a^t f(x)dx + \int_t^b f(x)dx = \int_a^{\infty} f(x)dx - \int_b^{\infty} f(x)dx.$$

Bundan esa  $\int_a^{\infty} f(x)dx$  integralning yaqinlashuvchi va

$$\int_a^{\infty} f(x)dx = \int_a^b f(x)dx + \int_b^{\infty} f(x)dx$$

ya'ni

$$\int_a^{\infty} f(x)dx = \int_a^b f(x)dx + \int_b^{\infty} f(x)dx$$

ekanligi kelib chiqadi.

Xuddi shunga o'xshash  $\int_a^{\infty} f(x)dx$  integralning yaqinlashuvchi bo'lishidan  $\int_a^{\infty} f(x)dx$  integralning ham yaqinlashuvchi hamda (15.4) formulaning o'rini bo'lishi ko'rsatiladi. ▶

2) Agar  $\int_a^x f(x)dx$  integral yaqinlashuvchi bo'lsa, u holda  $\int_a^x cf(x)dx$  integral ham yaqinlashuvchi bo'lib,

$$\int_a^x cf(x)dx = c \int_a^x f(x)dx$$

bo'ladi, bunda  $c = const.$

3) Agar  $\forall x \in [a, +\infty)$  da  $f(x) \geq 0$  bo'lsa, bu funksiyaning xosmasi integrali

$$\int_a^x f(x)dx \geq 0$$

bo'ladi.

Endi  $f(x)$  funksiya bilan bir qatorda  $g(x)$  funksiya ham  $[a, +\infty)$  oraliqda berilgan bo'lsin.

4) Agar  $\int_a^x f(x)dx$  da  $\int_a^x g(x)dx$  integrallar yaqinlashuvchi bo'lsa. u holda  $\int_a^x [f(x) \pm g(x)]dx$  integral ham yaqinlashuvchi bo'lib.

$$\int_a^x [f(x) \pm g(x)]dx = \int_a^x f(x)dx \pm \int_a^x g(x)dx$$

bo'ladi.

*I-natija.* Agar  $f_1(x), f_2(x), \dots, f_n(x)$  funksiyalarning har biri  $[a, +\infty)$  oraliqda berilgan bo'lib.  $\int_a^x f_k(x)dx$  ( $k = 1, 2, \dots, n$ ) integrallar yaqinlashuvchi bo'lsa, u holda

$$\int_a^x [c_1 f_1(x) + c_2 f_2(x) + \dots + c_n f_n(x)]dx$$

integral yaqinlashuvchi bo'lib,

$$\int_a^{+\infty} [c_1 f_1(x) + c_2 f_2(x) + \dots + c_n f_n(x)]dx = c_1 \int_a^{+\infty} f_1(x)dx + \dots + c_n \int_a^{+\infty} f_n(x)dx$$

bo'ladi.

5) Agar  $\forall x \in [a, +\infty)$  uchun  $f(x) \leq g(x)$  tengsizlik o'rini bo'lib.  $\int_a^x f(x)dx$  va  $\int_a^x g(x)dx$  integrallar yaqinlashuvchi bo'lsa, u holda

$$\int_a^x f(x)dx \leq \int_a^x g(x)dx$$

bo'ladi.

Yuqorida keltirilgan 2- 5- xossalarning isboti xosmas integral va uning yaqinlashuvchiligi ta'riflaridan bevosita kelib chiqadi.

**O'rta qiymat huqidagi teorema.**  $f(x)$  va  $g(x)$  funksiyalar  $[a, +\infty)$  oraliqda berilgan bo'lisin.  $f(x)$  funksiya shu oraliqda chegaralangan, ya'ni shunday  $m$  va  $M$  o'zgarmas sonlar mavjudki,  $\forall x \in [a, +\infty)$  uchun

$$m \leq f(x) \leq M$$

bo'lib,  $g(x)$  funksiya esa  $[a, +\infty)$  da o'z ishorasini o'zgartirmasini, ya'ni  $\forall x \in [a, +\infty)$  uchun har doim  $g(x) \geq 0$  yoki  $g(x) \leq 0$  bo'lisin.

6) Agar  $\int f(x)g(x)dx$  va  $\int g(x)dx$  integrallar yaqinlashuvchi bo'lsa, u holda shunday o'zgarmas  $\mu$  ( $m \leq \mu \leq M$ ) son topildiki,

$$\int_a^{\infty} f(x)g(x)dx = \mu \int_a^{\infty} g(x)dx \quad (15.6)$$

tenglik o'rini bo'ladi.

◀ Yuqorida keltirilgan  $g(x)$  funksiya  $[a, +\infty)$  oraliqda mansiy bo'lmasini:  $g(x) \geq 0$  ( $\forall x \in [a, +\infty)$ ). U holda

$$mg(x) \leq f(x)g(x) \leq Mg(x)$$

bo'lib, unda esa (Riman integralining tegishli xossasiga ko'ra)

$m \int_a^{\infty} g(x)dx < \int_a^{\infty} f(x)g(x)dx \leq M \int_a^{\infty} g(x)dx$  bo'lishini topamiz. Keyingi, tengsizliklarda  $t \rightarrow +\infty$  da limitga o'tsak,

$$m \int_a^{\infty} g(x)dx \leq \int_a^{\infty} f(x)g(x)dx \leq M \int_a^{\infty} g(x)dx \quad (15.7)$$

ekanligi kelib chiqadi. Ikki holni qaraylik:

a)  $\int_a^{\infty} g(x)dx = 0$  bo'lisin. U holda  $\int_a^{\infty} f(x)g(x)dx = 0$  bo'lib, bunda  $\mu$  deb  $m \leq \mu \leq M$  tengsizliklarni qanoatlantiruvchi ixtiyoriy sonni olish mumkin.

b)  $\int_a^{\infty} g(x)dx > 0$  bo'lisin. Bu holda (15.7) tengsizliklardan

$$m \leq \frac{\int_a^{\infty} f(x)g(x)dx}{\int_a^{\infty} g(x)dx} \leq M$$

bo'lishi kelib chiqadi. Agar

$$\mu = \frac{\int_a^{\infty} f(x)g(x)dx}{\int_a^{\infty} g(x)dx}$$

deb olsak, unda

$$\int_a^x f(x)g(x)dx = \mu \int_a^x g(x)dx$$

bo'ldi.

$[a, +\infty)$  oraliqda  $g(x) \leq 0$  bo'lganda (15.6) formula xuddi shunga o'xshash isbotlanadi. ▶

Bu 6- xossa o'rta qiymat haqidagi teorema deb ham yuritiladi.

4<sup>th</sup>. Xosmas integrallarni hisoblash. Ushbu

$$J = \int_a^{+\infty} f(x)dx$$

xosmas integral yaqinlashuvchi bo'lsin. Uni hisoblash masalasini qaraymiz.

1) *Nyuton-Leybnits formulasi*. Faraz qilaylik,  $f(x)$  funksiya  $[a, +\infty)$  oraliqda uzliksiz bo'lsin. Ma'lumki, bu holda  $f(x)$  funksiya shu oraliqda  $\phi(x)$  ( $\phi'(x) = f(x), x \in [a, +\infty)$ ) boshlang'ich funksiyaga ega bo'ladi.  $x \rightarrow +\infty$  da  $\phi(x)$  funksiyaning limiti mavjud va chekli bo'lsa, bu limitni  $\phi(x)$  boshlang'ich funksiyaning  $+\infty$  dagi qiymati deb qahul qilamiz, ya'ni

$$\lim_{x \rightarrow +\infty} \phi(x) = \phi(+\infty).$$

Xosmas integral ta'rfi hamda Nyuton-Leybnits formulasidan foydalanib quyidagini topamiz:

$$\begin{aligned} \int_a^{+\infty} f(x)dx &= \lim_{t \rightarrow +\infty} \int_a^t f(x)dx = \lim_{t \rightarrow +\infty} \int_a^t [\phi(t) - \phi(a)] = \\ &= \phi(+\infty) - \phi(a) = \phi(x) \Big|_a^{+\infty} \end{aligned} \quad (15.8)$$

Bu esa yuqoridagi kelishuvga ko'ra boshlang'ich funksiyaga ega bo'lgan  $f(x)$  funksiya xosmas integrali uchun Nyuton-Leybnits formulasini o'rinni bo'lishini ko'rsatadi.

15.4-misol. Ushbu

$$\int_2^{+\infty} \frac{1}{x^2} \sin \frac{1}{x} dx$$

xosmas integral hisoblansin.

◀ Ravshanki.  $f(x) = \frac{1}{x^2} \sin \frac{1}{x}$  funksiya  $\left[ \frac{2}{\pi}, +\infty \right)$  oraliqda uzliksiz bo'llib, uning boshlang'ich funksiyasi  $\phi(x) = \cos \frac{1}{x}$  bo'ladi. Demak, (15.8) formulaga ko'ra

$$\int_2^{+\infty} \frac{1}{x^2} \sin \frac{1}{x} dx = \cos \frac{1}{x} \Big|_2^{+\infty} = 1. ▶$$

Ba'zan berilgan  $\int f(x)dx$  xosmas integral o'zgaruvchilarni almashtirib yoki bo'laklab integrallash natijasida hisoblanadi.

**2) Bo'laklab integrallash usuli.**  $u(x)$  va  $v(x)$  funksiyalarning har biri  $[a, +\infty)$  oraliqida berilgan hamda uzluski  $u'(x)$  va  $v'(x)$  hisoblalarga ega bo'lsin.

Agar  $\int v(x)du(x)$  integral yaqinlashuvchi hamda ushbu

$$\lim_{t \rightarrow +\infty} u(t) = u(+\infty), \quad \lim_{t \rightarrow +\infty} v(t) = v(+\infty)$$

limitlar mavjud va chekli bo'lsa, u holda  $\int u(x)dv(x)$  integral yaqinlashuvchi bo'lib,

$$\int_a^{\infty} u(x)dv(x) = u(x)v(x)|_a^{+\infty} - \int_a^{\infty} v(x)du(x) \quad (15.9)$$

bo'ladi.

Haqiqatdan ham I-qism, 9-boh, 10-§ da keltirilgan formulaga ko'ra

$$\begin{aligned} \int u(x)dv(x) &= u(x)v(x)|_a^t - \int v(x)du(x) = [u(t)v(t) - u(a)v(a)] \\ &\quad - \int v(x)du(x) \end{aligned} \quad (15.10)$$

bo'lib, bu tenglikda  $t \rightarrow +\infty$  da limitga o'tib, quyidagini topamiz:

$$\lim_{t \rightarrow +\infty} \int_a^t u(x)dv(x) = \lim_{t \rightarrow +\infty} [u(t)v(t) - u(a)v(a)] - \lim_{t \rightarrow +\infty} \int_a^t v(x)du(x).$$

Shartga ko'ra  $\int_a^{\infty} v(x)du(x)$  integral yaqinlashuvchi hamda  $\lim_{t \rightarrow +\infty} [u(t)v(t) - u(a)v(a)]$  limit mavjud va chekli ekanligini e'tiborga olsak, unda (15.10) munosabatdan  $\int u(x)dv(x)$  integralning yaqinlashuvchiligi hamda (15.9) formulaning o'rinni bo'lishi kelib chiqadi.

### 15.5-misol Qo'yidagi

$$\int_0^{\infty} xe^{-x} dx$$

integralni hisoblansin.

Agar  $u(x) = x$ ,  $dv(x) = e^{-x}dx$  deyilsa, unda  $u(x)v(x)|_0^{+\infty} = x(e^{-x})|_0^{+\infty} = \lim_{t \rightarrow +\infty} (-xe^{-t}) = 0$ .  $\int v(x)du(x) = -e^{-x}|_0^{+\infty} = -1$  bo'lib, (15.9) formulaga ko'ra

$$\int_a^{\infty} u(x)dv(x) = \int_0^{\infty} xe^{-x} dx = -xe^{-x}|_0^{+\infty} - \int_0^{\infty} (-e^{-x})dx = 1$$

bo'ladi. Demak,

$$\int_0^{\infty} xe^{-x} dx = 1. \blacksquare$$

**2-eslatma.** Yuqoridagi (15.9) formulani keltirib chiqarishda  $\int v(x)du(x)$  integralning yaqinlashuvchiligi hamda  $\lim_{t \rightarrow +\infty} u(t)v(t)$  limitning mavjud va chekli bo'lishi talab etiladi.

Agar  $\int u(x)dv(x)$ ,  $\int v(x)du(x)$  integrallarning yaqinlashuvchiligi hamda  $\lim_{t \rightarrow -\infty} u(t)v(t)$  limitning mavjud va chekli bo'lishi bo'lsa, u holda ularning uchinchisi hamda (15.9) formula o'rini bo'ladi.

**3) O'zgaruvchilarni almash tirish usuli.** Quyidagi

$$J = \int_a^{+\infty} f(x)dx$$

integralni qaraylik. Bu integralda  $x = \varphi(z)$  deylik, bunda  $\varphi(z)$  funksiya quyidagi shartlarni bajarsin:

a)  $\varphi(z)$  funksiya  $(\alpha, +\infty)$  oraliqda berilgan,  $\varphi'(z)$  hosilaga ega va bu hosila uzluksiiz;

b)  $\varphi(z)$  funksiya  $(\alpha, +\infty)$  oraliqda qat'iy o'suvchi;

v)  $\varphi(\alpha) = a$ ,  $\varphi(+\infty) = \lim_{z \rightarrow +\infty} \varphi(z) = +\infty$  bo'lsin.

U holda  $\int f(\varphi(z)) \cdot \varphi'(z)dz$  integral yaqinlashuvchi bo'lsa, unda  $\int f(x)dx$  ham yaqinlashuvchi va

$$\int_a^{+\infty} f(x)dx = \int_a^{+\infty} f(\varphi(z)) \cdot \varphi'(z)dz \quad (15.11)$$

bo'ladi.

◀ Ixtiyoriy  $z$  ( $\alpha < z < +\infty$ ) nuqtani olib, unga mos  $\varphi(z) = t$  nuqtani topamiz.  $[a, t]$  oraliqda 1-qism, 9-bob, 2-§ da keltirilgan formulaga ko'ra

$$\int_a^t f(x)dx = \int_a^t f(\varphi(z)) \cdot \varphi'(z)dz$$

bo'ladi. Bu munosabatda  $t \rightarrow +\infty$  da (bunga  $z = \varphi^{-1}(t) \rightarrow +\infty$ ) limitga o'tib quyidagini topamiz:

$$\lim_{t \rightarrow +\infty} \int_a^t f(x)dx = \int_a^{+\infty} f(\varphi(z)) \cdot \varphi'(z)dz.$$

Bu esa  $\int f(x)dx$  integralning yaqinlashuvchiligidini hamda (15.11) formula-ning o'rinni bo'lishini ko'rsatadi. ▶

**3-eslatma.**  $\int f(x)dx$  yaqinlashuvchi bo'lsin. Bu integralda

$$x = \phi(z)$$

bo'lib, bu funksiya yuqorida shartlarni bajarsin. U holda

$$\int f(\phi(z)) \phi'(z) dz$$

integral ham yaqinlashuvchi bo'lib,

$$\int f(x)dx = \int f(\phi(z)) \phi'(z) dz$$

bo'ladi.

**15.6-misol.** Ushbu

$$J = \int_0^\infty \frac{dx}{1+x^4} \quad (15.12)$$

integral hisoblansin.

◀ Ravshanki, bu integral yaqinlashuvchi. Uni hisoblaylik. Avvalo bu integral  $x = \frac{1}{z}$  almashish qilamiz. Natijada

$$J = \int_{+\infty}^0 \frac{1}{1 + \frac{1}{z^4}} \left( -\frac{1}{z^2} \right) dz = \int_0^{+\infty} \frac{z^2}{1+z^4} dz \quad (15.13)$$

bo'lib, (15.12) va (15.13) tengliklardan

$$J = \frac{1}{2} \int_0^{+\infty} \frac{1+x^2}{1+x^4} dx$$

bo'lishi kelib chiqadi. Keyingi integralda

$$x = \frac{y + \sqrt{y^2 + 4}}{2} \quad \left( x - \frac{1}{x} = y \right)$$

almash tirishni hajarib, quyidagini topamiz:

$$J = \frac{1}{2} \int_{-\infty}^{+\infty} \frac{dy}{2+y^2} = \frac{1}{2\sqrt{2}} \arctg \frac{y}{\sqrt{2}} \Big|_{-\infty}^{+\infty} = \frac{\pi}{2\sqrt{2}}.$$

Demak,

$$\int_0^\infty \frac{dx}{1+x^2} = \frac{\pi}{2\sqrt{2}}. ▶$$

## 2-§. Chegaralanmagan funksiyaning xosmas integrallari

**1°. Funksiyaning maxsus nuqtasi.**  $X \subset R$  to'plamda berilgan  $f(x)$  funksiya va  $x_0 \in R$  nuqtanining ushbu

$$\dot{U}_\delta(x_0) = \{x \in R : x_0 - \delta < x < x_0 + \delta; x \neq x_0\} (\delta > 0)$$

atrofini qaraylik.

**4-ta'rif.** Agar  $f(x)$  funksiya  $\dot{U}_\delta(x_0) \cap X \neq \emptyset$  to'plamda chegaralanmagan bo'lsa,  $x_0$  nuqta  $f(x)$  funksiyaning maxsus nuqtasi deyiladi.

Masalan,

$$1) f(x) = \frac{1}{\theta - x} \text{ funksiya } (a < x < \theta) \text{ uchun } x = \theta \text{ maxsus nuqta};$$

$$2) f(x) = \frac{1}{x - a} \text{ funksiya } (a < x \leq \theta) \text{ uchun } x = a \text{ maxsus nuqta};$$

$$3) f(x) = \frac{1}{x(x^2 - 1)} \text{ funksiya } (x \in R \setminus \{-1, 0, 1\}) \text{ uchun } x = -1, x = 0, x = 1 \text{ maxsus nuqtalar bo'ladi.}$$

**2°. Chegaralanmagan funksiyaning xosmas integrali tushunchasi.**  $f(x)$  funksiya  $[a, \theta]$  yarim integralda berilgan bo'lib,  $x = \theta$  nuqta uning maxsus nuqtasi bo'lsin. Bu funksiya  $[a, \theta]$  yarim integralning istalgan  $[a, t]$  qismida ( $a < t < \theta$ ) integrallanuvchi bo'lsin. Ravshanki,

$$\int_a^\theta f(x) dx$$

integral  $t$  o'zgaruvchiga bog'liq bo'ladi:

$$F(t) = \int_a^t f(x) dx.$$

**5-ta'rif.** Agar  $t \rightarrow \theta - 0$  da  $F(x)$  funksiyaning limiti mavjud bo'lsa, bu limit chegaralanmagan  $f(x)$  funksiyaning  $[a, \theta]$  oraliq bo'yicha xosmas integrali deyiladi va

$$\int_a^\theta f(x) dx$$

kabi belgilanadi:

$$\int_a^\theta f(x) dx = \lim_{t \rightarrow \theta - 0} F(x) = \lim_{t \rightarrow \theta - 0} \int_a^t f(x) dx. \quad (15.14)$$

Agar  $t \rightarrow \theta - 0$  da  $F(x)$  funksiyaning limiti mavjud va chekli bo'lsa, (15.14) xosmas integral yaqinlashuvchi deyiladi.

Agar  $t \rightarrow \theta - 0$  da  $F(x)$  funksiyaning limiti cheksiz yoki  $F(x)$  funksiyaning limiti mavjud bo'lmasa, (15.14) xosmas integral uzoqlashuvchi deyiladi.

Masalan. ushbu

$$\int_0^1 \frac{dx}{\sqrt{1-x^2}}$$

xosmas integral ( $x = 1$  maxsus nuqta) yaqinlashuvchi bo'ldi. chunki

$$\lim_{t \rightarrow 1-0} \int_0^t \frac{dx}{\sqrt{1-x^2}} = \lim_{t \rightarrow 1-0} (\arcsint)'_0^t = \lim_{t \rightarrow 1-0} \arcsint = \frac{\pi}{2}$$

va demak,

$$\int_0^1 \frac{dx}{\sqrt{1-x^2}} = \frac{\pi}{2}$$

( $a, b$ ) da berilgan  $f(x)$  funksiyaning ( $x = a$  maxsus nuqta), ( $a, b$ ) da berilgan  $f(x)$  funksiyaning ( $x = a$ ,  $x = b$  maxsus nuqtalar) xosmas integrallari va ularning yaqinlashuvchiligi (uzoqlashuvchiligi) yuqoridagi kabi ta'riflanadi:

$$\int_a^b f(x) dx = \lim_{t \rightarrow a+0} \phi(t) = \lim_{t \rightarrow a+0} \int_t^b f(x) dx.$$

$$\int_a^b f(x) dx = \lim_{\substack{s \rightarrow b-a \\ t \rightarrow a+0}} \phi(t, s) = \lim_{\substack{s \rightarrow b-a \\ t \rightarrow a+0}} \int_t^s f(x) dx.$$

Masalan, ushbu

$$\int_0^1 \frac{dx}{\sqrt{x}}$$

xosmas integral ( $x = 0$  maxsus nuqta) yaqinlashuvchi bo'ldi. chunki

$$\lim_{t \rightarrow +0} \int_0^t \frac{dx}{\sqrt{x}} = \lim_{t \rightarrow +0} 2(1 - \sqrt{t}) = 2$$

va demak,

$$\int_0^1 \frac{dx}{\sqrt{x}} = 2.$$

**15.7-misol.** Ushbu

$$J_1 = \int_a^b \frac{dx}{(x-a)^\alpha}, \quad J_2 = \int_a^b \frac{dx}{(b-x)^\alpha} \quad (\alpha > 0)$$

$$J_1 = \int_a^b \frac{dx}{(x-a)^\alpha} = \lim_{t \rightarrow a+0} \int_t^b \frac{dx}{(x-a)^\alpha}$$

Aytaylik,  $\alpha = 1$  bo'lsin. Bu holda

$$\lim_{t \rightarrow a+0} \int_t^b \frac{dx}{x-a} = \lim_{t \rightarrow a+0} [\ln(x-a)]_t^b = \infty$$

bo'ldi.

Aytaylik,  $\alpha \neq 1$  bo'lsin. Bu holda

$$\lim_{t \rightarrow a+0} \int_t^b \frac{dx}{(x-a)^\alpha} = \lim_{t \rightarrow a+0} \left[ \frac{(x-a)^{1-\alpha}}{1-\alpha} \right]_t^b = \lim_{t \rightarrow a+0} \frac{1}{1-\alpha} [(b-a)^{1-\alpha} - (t-a)^{1-\alpha}]$$

bo'ldi. Bu limit  $0 < \alpha < 1$  bo'lganda chekli,  $\alpha > 1$  bo'lganda cheksiz bo'ldi.

Shunday qilib,

$$J_1 = \int_a^b \frac{dx}{(x-a)^\alpha}, \quad (\alpha > 0)$$

xosmas integral  $\alpha < 1$  bo'lganda yaqinlashuvchi,  $\alpha \geq 1$  bo'lganda uzoqlashuvchi bo'ladi.

Xuddi shunga o'xhash ko'rsatish mumkinki,

$$J_2 = \int_a^b \frac{dx}{(a-x)^\alpha} \quad (\alpha > 0)$$

xosmas integral  $\alpha < 1$  bo'lganda yaqinlashuvchi,  $\alpha \geq 1$  bo'lganda uzoqlashuvchi bo'ladi.

Chegaralanmagan funksiyaning xosmas integrali haqidagi bu tushunchalarni I-§ da keltirilgan cheksiz oraliq bo'yicha xosmas integral tushunchalari bilan solishtirib, ularning o'xshashligini va bu xosmas integrallarni bitta nuqtai nazaridan, ya'ni

$$\int_a^b f(x) dx$$

integralda:

1)  $f(x)$  funksiyaning  $[a, \theta]$  oraliq berilgan bo'lib, bunda  $a$  - chekli nuqta,  $\theta$  - chekli yoki  $+\infty$ ;

2)  $f(x)$  funksiya ixtiyori  $[a, t]$  da integrallanuvchi, bunda  $t \in [a, \theta]$  deb qarash mumkinligini ko'ramiz. Bu hol chegaralanmagan funksiyaning xosmas integrali haqidagi keyingi tushuncha va tasdiqlarni keltirish bilan kifoyalanish imkonini beradi.

**3<sup>o</sup>. Xosmas integrallarning yaqinlashuvchiligi.** Integralning absolyut yaqinlashuvchiligi. Aytaylik,  $f(x)$  funksiya  $[a, \theta]$  oraliqda berilgan bo'lib,  $\theta$  nuqta  $f(x)$  funksiyaning maxsus nuqtasi bo'lsin.

**6-teorema.** Faraz qilaylik,  $\forall x \in [a, \theta]$  da  $f(x) > 0$  bo'lsin. Bu funksiyaning  $[a, \theta]$  oraliq bo'yicha xosmas integrali

$$\int_a^b f(x) dx$$

ning yaqinlashuvchi bo'lishi uchun,

$$F(t) = \int_a^t f(x) dx \quad (a < t < \theta)$$

funksiyaning yuqoridan chegaralangan, ya'ni

$$\exists C \in R, \quad \forall t \in [a, \theta]: \quad \int_a^t f(x) dx \leq C$$

bo'lishi zarur va yetarli.

**7-teorema.**  $f(x)$  va  $g(x)$  funksiyalar  $[a, \theta]$  oraliqda berilgan ( $\theta$  maxsus nuqta) bo'lib,  $\forall x \in [a, \theta]$  da

$$0 \leq f(x) < g(x)$$

bo'lsin.

Agar  $\int_a^b g(x)dx$  yaqinlashuvchi bo'lsa,  $\int_a^b f(x)dx$  ham yaqinlashuvchi, agar  $\int_a^b f(x)dx$  uzoqlashuvchi bo'lsa,  $\int_a^b g(x)dx$  ham uzoqlashuvchi bo'ladi.

**15.8-misol.** Ushbu

$$\int_0^{\frac{\pi}{2}} \frac{\cos x}{\sqrt[4]{1-x}} dx$$

xosmas integral yaqinlashuvchilikka tekshirilsin.

◀ Ravshanki, integral ostidagi funksiya

$$f(x) = \frac{\cos x}{\sqrt[4]{1-x}} \geq 0$$

bo'ladi. Ayni paytda,  $\forall x \in (0, 1)$  da

$$f(x) = \frac{\cos x}{\sqrt[4]{1-x}} \leq \frac{1}{\sqrt[4]{1-x}} = \frac{1}{(1-x)^{\frac{1}{4}}}$$

tengsizlik bajariladi. Ma'lumki,  $g(x) = \frac{1}{(1-x)^{\frac{1}{4}}}$  funksiyaning integrali

$$\int_0^1 \frac{1}{(1-x)^{\frac{1}{4}}} dx$$

yaqinlashuvchi. Unda 7-teoremaga ko'ra berilgan xosmas integral yaqinlashuvchi bo'ladi. ►

**8-teorema. (Koshi teoremasi).** Ushbu

$$\int_a^\theta f(x)dx \quad (\theta \text{ maxsus nuqta})$$

xosmas integralning yaqinlashuvchi bo'lishi uchun

$\forall \varepsilon > 0, \exists \delta > 0, \forall t', t'', \theta - \delta < t' < \theta, \theta - \delta < t'' < \theta:$

$$\left| \int_{t'}^{t''} f(x)dx \right| < \varepsilon$$

bo'lishi zarur va yetarli.

Aytaylik,  $f(x)$  funksiya  $[a, \theta]$  oraliqda berilgan,  $\theta$  nuqta funksiyaning maxsus nuqtasi bo'lib,

$$\int_a^\theta f(x)dx$$

uning xosmas integrali bo'lsin. Bu integral bilan bir qatorda

$$\int_a^\theta |f(x)|dx$$

xosmas integralni qaraymiz.

**9-teorema.** Agar

$$\int |f(x)| dx$$

integral yaqinlashuvchi bo'lsa, u holda

$$\int f(x) dx$$

integral ham yaqinlashuvchi bo'ladi.

**6-ta'rif.** Agar

$$\int |f(x)| dx$$

integral yaqinlashuvchi bo'lsa,  $\int_a^b |f(x)| dx$  absolyut yaqinlashuvchi integral deyiladi.

Agar  $\int_a^b f(x) dx$  yaqinlashuvchi bo'lib,  $\int_a^b |f(x)| dx$  uzoqlashuvchi bo'lsa.

$\int f(x) dx$  shartli yaqinlashuvchi integral deyiladi.

**4°. Yaqinlashuvchi xosmas integrallarning xossalari.** Chegaralanmagan funksiyaning xosmas integrali ham cheksiz oraliq bo'yicha integrali xossalari kabi xossalarga ega. Ularni keltirishni hamda isbotlashni o'quvchiga havola etamiz.

**5°. Xosmas integrallarni hisoblash.**  $f(x)$  funksiya  $[a, b]$  da berilgan,  $a$  esa shu funksiyaning maxsus nuqtasi bo'lsin. Bu funksiyaning xosmas integrali

$$J = \int_a^b f(x) dx$$

yaqinlashuvchi, uni hisoblash talab etilsin.

1) **Nyuton-Leybnits formulasi.** Faraz qilaylik,  $f(x)$  funksiya  $[a, b]$  da uzlusiz bo'lsin. Ma'lumki, bu holda  $f(x)$  funksiya shu oraliqda  $\phi(x)$  ( $\phi'(x) = f(x), x \in [a, b]$ ) boshlang'ich funksiyaga ega bo'ladi,  $t \rightarrow b - a$  da  $\phi(x)$  funksiyaning limiti mavjud va chekli bo'lsa, bu limitni  $\phi(x)$  boshlang'ich funksiyaning  $b$  nuqtasidagi qiymati deb qabul qilamiz:

$$\lim_{t \rightarrow b} \phi(x) = \phi(b).$$

Xosmas integral ta'rifi hamda Nyuton-Leybnits formulasidan foydalanib quyidagini topamiz:

$$\int_a^b f(x) dx = \lim_{t \rightarrow b} \int_a^t f(x) dx = \lim_{t \rightarrow b} (\phi(t) - \phi(a)) = \phi(b) - \phi(a) = \phi(x)|_a^b.$$

Bu esa, yuqorida kelishuv asosida, boshlang'ich funksiyaga ega bo'lgan funksiya xosmas integrali uchun Nyuton-Leybnits formulasini o'rinni bo'lishini ko'rsatadi.

Berilgan xosmas integral o'zgaruvchilarni almashtirib yoki bo'laklab integrallash natijasida hisoblanishi mumkin.

2) *Bo'laklab integrallash usuli.*  $u(x)$  va  $v(x)$  funksiyalarning har biri  $[a, b]$  da berilgan bo'lib, shu oraliqda uzlusiz  $u'(x)$  va  $v'(x)$  hosalalarga ega bo'lsin.  $\epsilon$  nuqta esa  $v(x)$   $u'(x)$  hamda  $u(x)$   $v'(x)$  funksiyalarning maxsus nuqtalari.

Agar  $\int v(x)du(x)$  integral yaqinlashuvchi hamda ushbu

$$\lim_{\epsilon \rightarrow 0^+} u(t)v(t)$$

limit mavjud va chekli bo'lsa, u holda  $\int u(x)dv(x)$  integral yaqinlashuvchi bo'lib,

$$\int u(x)dv(x) = u(x)v(x) \Big|_a^b - \int v(x)du(x) \quad (15.15)$$

bo'ladi, bunda

$$u(\epsilon)v(\epsilon) = \lim_{\epsilon \rightarrow 0^+} u(t)v(t)$$

**15.9-misol.** Ushbu

$$\int_0^1 \frac{(x+1)dx}{\sqrt[3]{(x-1)^2}}$$

integralni qaraylik. Agar  $u(x) = x+1$ ,  $dv(x) = \frac{1}{\sqrt[3]{(x-1)^2}} dx$  deb olsak, unda

$$u(x)v(x) \Big|_0^1 = (x+1)\sqrt[3]{(x-1)} \Big|_0^1 = 3,$$

$$\int_0^1 v(x)du(x) = \int_0^1 3(x-1)^{\frac{1}{3}} dx = \frac{9}{4}(x-1)^{\frac{4}{3}} \Big|_0^1 = -\frac{9}{4}$$

bo'lub, (15.15) formulaga ko'r'a

$$\int_0^1 v(x)du(x) = \int_0^1 \frac{(x+1)dx}{\sqrt[3]{(x-1)^2}} = 3 - \left(-\frac{9}{4}\right) = \frac{21}{4}$$

bo'ladi. Demak,

$$\int_0^1 \frac{(x+1)dx}{\sqrt[3]{(x-1)^2}} = \frac{21}{4}$$

**3-eslatma.** Yuqoridagi (15.15) formulani keltirib chiqarishda  $\int v(x)du(x)$  integralning yaqinlashuvchiligi hamda  $\lim_{t \rightarrow x-a} [u(t) \cdot v(t)]$  limitning mavjud va chekli bo'lishi talab etiladi.

Agar  $\int u(x)dv(x)$ ,  $\int v(x)du(x)$  integrallarning yaqinlashuvchiligi hamda  $\lim_{x \rightarrow \infty} [u(t) \cdot v(t)]$  limitning mavjud va chekli bo'lishi kabi uchta faktdan istalgan ikkitasi o'rinni bo'lsa, unda ularning uchinchisi hamda (15.15) formula o'rinni bo'ladi.

3) *O'zgaruvchilarni almash tirish usuli.*  $f(x)$  funksiya  $[a, b]$  da berilgan, esa shu funksiyaning maxsus nuqtasi bo'lsin. Quyidagi

$$\int f(x)dx$$

xosmas integralni qaraylik. Bu integralda  $x = \varphi(z)$  deylik, bunda  $\varphi(z)$  funksiya  $[\alpha, \beta]$  oraliqda  $\varphi'(z) > 0$  hosilaga ega va u uzlusiz hamda  $\varphi(\alpha) = a$ ,  $\varphi(\beta) = b$ ,  $\varphi(\beta) = \lim_{z \rightarrow b^-} \varphi(z)$ . Agar  $\int_a^b f(\varphi(z)) \varphi'(z)dz$  integral yaqinlashuvchi bo'lsa, u holda  $\int f(x)dx$  integral ham yaqinlashuvchi bo'lib.

$$\int_a^b f(x)dx = \int_a^b f(\varphi(z)) \varphi'(z)dz$$

bo'ladi.

**4-eslatma.** Aytaylik,  $\int f(x)dx$  integral yaqinlashuvchi bo'lsin. Bu integralda  $x = \varphi(z)$  bo'lib, u yuqoridagi shartlarni bajarsin. U holda  $\int f(\varphi(z)) \varphi'(z)dz$  integral ham yaqinlashuvchi bo'lib,

$$\int_a^b f(x)dx = \int_a^b f(\varphi(z)) \varphi'(z)dz$$

bo'ladi.

### 15.10-misol. Ushbu

$$J = \int_0^1 \frac{dx}{(1+x)\sqrt{x}}$$

integralda  $x = \varphi(z) = z^2$  almash tirish bajaramiz. Ravshanki, bu  $x = z^2$  funksiya  $(0, 1]$  oraliqda  $x' = 2z > 0$  hosilaga ega va u uzlusiz hamda  $\varphi(0) = 0$ ,  $\varphi(1) = 1$ . Integralni hisoblaymiz:

$$J = \int_0^1 \frac{2dz}{1+z^2} = 2 \arctg z \Big|_0^1 = 2 \cdot \frac{\pi}{4} = \frac{\pi}{2}.$$

### 3-§. Muhim misallar

Ushbu paragrafda ikkita xosmas integrallarning yaqinlashuvchilikka tekshiramiz. Bu integrallar kelgusida juda ahamiyatli bo'lib, ulardan ko'p masalalarni echishda foydalilanadi.

#### 15.11-misol. Ushbu

$$J_1 = \int_0^{\infty} x^{a-1} e^{-x} dx$$

xosmas integral yaqinlashuvchilikka tekshirilsin.

• Ravshanki,  $J_1$  cheksiz oraliq bo'yicha xosmas integral. Ayni paytda,  $a < 1$  bo'lganda  $x = 0$  nuqta integral ostidagi funksiyaning maxsus nuqtasi bo'lgani sababi  $J_1$  chegaralanmagan funksiyaning xosmas integrali ham bo'ladi.

Bu integralni quyidagicha

$$\int_0^{\infty} x^{a-1} e^{-x} dx = \int_0^1 x^{a-1} e^{-x} dx + \int_1^{\infty} x^{a-1} e^{-x} dx$$

yozib olamiz. So'ng tenglikning o'ng tomonidagi integrallarning har birini alohida-alohida yaqinlashuvchilikka tekshiramiz. Integrallarning birinchisi

$$\int_0^1 x^{a-1} e^{-x} dx$$

da integral ostidagi funksiya uchun

$$\frac{1}{e} \cdot \frac{1}{x^{1-a}} \leq x^{a-1} e^{-x} \leq \frac{1}{x^{1-a}} \quad (0 < x \leq 1)$$

tengsizliklar o'tinli bo'ladi. Ma'lumki,

$$\int_0^1 \frac{dx}{x^{1-a}}$$

integral  $1 - a < a$  ya'ni  $a > 0$  da yaqinlashuvchi bo'ladi. Unda 7-teoremadan foydalanib

$$\int_0^1 x^{a-1} e^{-x} dx$$

ning  $a > 0$  da yaqinlashuvchi bo'llishini topamiz.

Ravshanki,

$$\lim_{x \rightarrow \infty} \frac{x^{a-1} e^{-x}}{1} = \lim_{x \rightarrow \infty} \frac{x^{a+1}}{e^x} = 0.$$

Bu holda

$$\int_1^{\infty} x^{a-1} e^{-x} dx, \int_1^{\infty} \frac{dx}{x^2}$$

xosmas integrallar bir vaqtda yo yaqinlashuvchi yoki uzoqlashuvchi bo'ladi.

Ma'lumki,

$$\int_1^{\infty} \frac{dx}{x^2}$$

yaqinlashuvchi. Demak,

$$\int_0^{\infty} x^{a-1} e^{-x} dx$$

xosmas integral ixtiyoriy  $a$  jumladan  $a > 0$  da yaqinlashuvi bo'ladi.

Shunday qilib, berilgan

$$\int_0^{\infty} x^{a-1} e^{-x} dx$$

xosmas integral  $a > 0$  bo'lganda yaqinlashuvchi bo'ladi. ►

### 15.12-misol Ushbu

$$J_2 = \int_0^1 x^{a-1} (1-x)^{b-1} dx$$

xosmas integral yaqinlashuchilikka tekshirilsin.

◀ Integral ostidagi funksiya uchun

1)  $a < 1, b \geq 1$  bo'lganda  $x=0$  maxsus nuqta;

2)  $a \geq 1, b < 1$  bo'lganda  $x=1$  maxsus nuqta;

3)  $a < 1, b < 1$  bo'lganda  $x=0, x=1$  maxsus nuqtalar bo'ladi.

Berilgan xosmas integralni yaqinlashuvchilikka tekshirish uchun uni quyidagicha yozib olamiz:

$$\int_0^1 x^{a-1} (1-x)^{b-1} dx = \int_0^{\frac{1}{2}} x^{a-1} (1-x)^{b-1} dx + \int_{\frac{1}{2}}^1 x^{a-1} (1-x)^{b-1} dx.$$

Ravshanki,

$$\lim_{x \rightarrow 0} (1-x)^{b-1} = 1, \quad \lim_{x \rightarrow 1} x^{a-1} = 1.$$

U holda

$$\lim_{x \rightarrow 0} \frac{x^{a-1} (1-x)^{b-1}}{x^{a-1}} = 1, \quad \lim_{x \rightarrow 1} \frac{x^{a-1} (1-x)^{b-1}}{(1-x)^{b-1}} = 1$$

bo'lib, 9-teoremaiga ko'ra

$$\int_0^{\frac{1}{2}} x^{a-1} (1-x)^{b-1} dx \text{ bilan } \int_0^{\frac{1}{2}} x^{a-1} dx,$$

hamda

$$\int_{\frac{1}{2}}^1 x^{a-1} (1-x)^{b-1} dx \text{ bilan } \int_{\frac{1}{2}}^1 (1-x)^{b-1} dx$$

xosmas integrallar bir vaqtida yaqinlashuvchi bo'ladi, yoki uzoqlashuvchi bo'ladi.

Ma'lumki,  $a > 0$  bo'lganda

$$\int_0^{\frac{1}{2}} x^{a-1} dx$$

xosmas integral yaqinlashuvchi,  $b > 0$  bo'lganda

$$\int_2^1 (1-x)^{n-1} dx$$

Xosmas integral yaqinlashuvchi. Demak,

$a > 0$  bo'lganda  $\int_0^2 x^{a-1}(1-x)^{n-1} dx$  integral.

$a > 0$  bo'lganda  $\int_0^2 x^{a-1}(1-x)^{n-1} dx$  integral yaqinlashuvchi bo'ladi.

Shunday qilib,

$$\int_0^2 x^{a-1}(1-x)^{n-1} dx$$

Xosmas integral  $a > 0, n > 0$  bo'lganda yaqinlashuvchi.

### Mashqlar

#### 15.13. Ushbu

$$J = \int_{-\infty}^{\infty} \frac{dx}{x^2 + x + 1}$$

Xosmas integralning yaqinlashuvchiligi ko'rsatilsin, qiymati topilsin.

#### 15.14. Ushbu

$$\int_0^{\infty} f(x) dx$$

Integral uchun yaqinlashuvchilik teoremlari keltirilsin.

15.15. Aytaylik.  $\forall x \in [a, +\infty)$  da  $f(x) \geq 0, g(x) > 0$  funksiyalar uchun

$$\lim_{x \rightarrow +\infty} \frac{f(x)}{g(x)} = k \text{ bo'lsin. Agar:}$$

1)  $k < +\infty$  va  $\int_a^{\infty} g(x) dx$  yaqinlashuvchi bo'lsa,  $\int_a^{\infty} f(x) dx$  ham yaqinlashuvchi;

2)  $k > 0$  va  $\int_a^{\infty} g(x) dx$  uzoqlashuvchi bo'lsa,  $\int_a^{\infty} f(x) dx$  ham uzoqlashuvchi bo'lishi isbotlansin.

15.16. Yuqoridagi 15.15-masala shartida  $0 < k < +\infty$  bo'lganda  $\int_a^{\infty} f(x) dx$  va

$\int_a^{\infty} g(x) dx$  xosmas integrallar bir vaqtda yoki yaqinlashuvchi yoki uzoqlashuvchi bo'lishi isbotlansin.

15.17. Aytaylik.  $f(x)$  funksiya  $[a, +\infty)$  oraliqida berilgan bo'lib, uning ixtiyoriy  $[a, t]$  qismida ( $a < t < +\infty$ ) integrallanuvchi bo'lsin. Agar  $x \rightarrow +\infty$  da

$$f(x) \sim \frac{A}{x^\alpha} \quad (A \neq 0)$$

bo'lsa, u holda

$$\int_a^{+\infty} f(x) dx$$

xosmas integral  $\alpha > 1$  bo'lganda yaqinlashuvchi,  $\alpha \leq 1$  bo'lganda uzoqlashuvchi bo'lishi ko'rsatilsin.

**15.18.** Ushbu

$$\int_1^{+\infty} \frac{\sin x}{x^\alpha} dx$$

xosmas integral

- a)  $\alpha > 1$  bo'lganda absolyut yaqinlashuvchi;
- b)  $0 < \alpha \leq 1$  bo'lganda shartli yaqinlashuvchi;
- v)  $\alpha \leq 0$  bo'lganda uzoqlashuvchi bo'lishi isbotlansin.

**15.19.** Agar  $f(x)$  funksiya  $(-\infty, +\infty)$  oraliqda berilgan bo'lib,

$$\lim_{t \rightarrow +\infty} \int_{-t}^t f(x) dx \quad (*)$$

mavjud bo'lsa, u holda  $\int_{-\infty}^{+\infty} f(x) dx$  xosmas integralning yaqinlashuvchi ham bo'lishi, uzoqlashuvchi ham bo'lishi ko'rsatilsin.

(Odatda (\*) limit chekli bo'lganda  $\int_{-\infty}^{+\infty} f(x) dx$  xosmas integral bosh qiymat ma'nosida yaqinlashuvchi deyilib, V.P.  $\int_{-\infty}^{+\infty} f(x) dx$  kabi belgilanadi).

### Parametrga bog'liq integrallar

Ushbu bobda ko'p o'zgaruvchili funksiyaning bitta o'zgaruvchisi bo'yicha integralini qaraymiz.

$f(x_1, x_2, \dots, x_m)$  funksiya biror  $M \subset R^m$  to'plamda berilgan bo'lzin. Bu funksiyaning bitta  $x_k$  ( $k = 1, 2, \dots, m$ ) o'zgaruvchisidan boshqa barcha o'zgaruvchilarini o'zgarmas deb hisoblasak,  $f(x_1, x_2, \dots, x_m)$  funksiya bitta  $x_k$  o'zgaruvchiga bog'liq bo'lgan funksiyaga aylanadi. Uning shu o'zgaruvchi bo'yicha integrali (agar u mavjud bo'lsa), ravshanki,  $x_1, x_2, \dots, x_{k-1}, x_{k+1}, \dots, x_m$  larga bog'liq bo'ladi. Bunday integrallar parametrga bog'liq integrallar tushunchasiga otib keladi.

Soddalik uchun ikki o'zgaruvchili  $f(x, y)$  funksiyaning bitta o'zgaruvchi bo'yicha integralini o'rganamiz. Bunda  $f(x, y)$  funksiyaning  $y$  o'zgaruvchisi bo'yicha limiti va unga intilishi xarakteri muhim rol o'ynaydi.

#### 1-8. Limit funksiya. Tekis yaqinlashish.

##### Limit funksiyaning uzluksizligi

$f(x, y)$  funksiya  $M = \{(x, y) \in R^2 : a \leq x \leq b, y \in E \subset R\}$  to'plamda berilgan,  $y_0$  esa  $E \subset R$  to'plamning limit nuqtasi bo'lzin.

$x$  o'zgaruvchining  $[a, b]$  oraliqdan olingan har bir tayin qiymatida  $f(x, y)$  funksiya  $y$  ninggina funksiyasiga aylanadi. Agar  $y \rightarrow y_0$  da bu funksiyaning limiti mavjud bo'lsa, ravshanki,  $y$  limit  $x$  o'zgaruvchining  $[a, b]$  oraliqdan olingan qiymatiga bog'liq bo'ladi:

$$\lim_{y \rightarrow y_0} f(x, y) = \varphi(x, y_0) = \varphi(x).$$

Bu  $\varphi(x)$  funksiya  $f(x, y)$  funksiyaning  $y \rightarrow y_0$  dagi limit funksiyasi deyiladi. Bu quyidagini anglatadi:  $\forall \varepsilon > 0, \exists \delta = \delta(\varepsilon, x) > 0, |y - y_0| < \delta$  bo'lgan  $\forall y \in E, |f(x, y) - \varphi(x)| < \varepsilon$ .

*I-ta'rif.*  $M$  to'plamda berilgan  $f(x, y)$  funksiyaning  $y \rightarrow y_0$  dagi limit funksiyasi  $\varphi(x)$  bo'lzin.  $\forall \varepsilon > 0$  olinganda ham shunday  $\delta = \delta(\varepsilon) > 0$  topilsaki,  $|y - y_0| < \delta$  tengsizlikni qanoatlantiruvchi  $\forall y \in E$  va  $\forall x \in [a, b]$  uchun

$$|f(x, y) - \varphi(x)| < \varepsilon$$

bo'lsa,  $f(x, y)$  funksiya limit funksiya  $\varphi(x)$  ga  $[a, b]$  da tekis yaqinlashadi deyiladi.

Aks holda, ya'ni  $\forall \delta > 0$  olinganda ham shunday  $\varepsilon_0 > 0, x_0 \in [a, b]$  va  $|y_1 - y_0| < \delta$  tengsizlikni qanoatlantiruvchi  $y_1 \in E$  topilsaki, ushbu

$$|f(x_0, y_1) - \varphi(x_0)| \geq \varepsilon_0$$

tengsizlik o'rinali bo'lsa,  $f(x, y)$  funksiya  $\varphi(x)$  ga notejis yaqinlashadi deyiladi.

**16.1-misol.**  $M = \{(x, y) \in R^2 : 0 \leq x \leq 1, 0 < y \leq \pi\}$  to'plamda berilgan ushbu  
 $f(x, y) = x \sin y$

funksiyaning  $y_0 = \frac{\pi}{3}$  nuqtada limit funksiyasi topilsin va unga tekis yaqinlashish ko'rsatilsin.

◀ Ravshanki,  $y \rightarrow y_0 = \frac{\pi}{3}$  bo'lгanda  $f(x, y) = x \sin y$  funksiyaning limiti

$$\frac{\sqrt{3}}{2}x$$
 ga teng bo'ladi. Demak,  $\varphi(x) = \frac{\sqrt{3}}{2}x$ .

$\forall \varepsilon > 0$  sonni olaylik. Agar  $\delta = \varepsilon$  desak, u holda  $|y - \frac{\pi}{3}| < \delta$  tengsizlikni qanoatlantirgan  $\forall y$  va  $\forall x \in [0, 1]$  uchun

$$|f(x, y) - \varphi(x)| = \left| x \sin y - \frac{\sqrt{3}}{2}x \right| = |x| \left| \sin y - \frac{\sqrt{3}}{2} \right| = |x| \left| \sin y - \sin \frac{\pi}{3} \right| \leq |x| \left| y - \frac{\pi}{3} \right| < \varepsilon$$

tengsizliklar bajariladi. I-ta'rifga ko'ra  $y \rightarrow \frac{\pi}{3}$  da berilgan  $f(x, y) = x \sin y$

funksiya limit funksiya  $\varphi(x) = \frac{\sqrt{3}}{2}x$  ga tekis yaqinlashadi. ▶

Endi  $f(x, y)$  funksiyaning limit funksiyaga ega bo'lishi va unga tekis yaqinlashishi haqidagi teoremani keltiramiz.

$f(x, y)$  funksiya  $M = \{(x, y) \in R^2 : a \leq x \leq b, y \in E\}$  to'plamda berilgan bo'lib,  $y_0$  esa  $E \subset R$  to'plamning limit nuqtasi bo'lisin.

**I-teorema.**  $f(x, y)$  funksiya  $y \rightarrow y_0$  da limit funksiya  $\varphi(x)$  ga ega bo'lishi va unga tekis yaqinlashishi uchun  $\forall \varepsilon > 0$  olinganda ham, shunday  $\delta = \delta(\varepsilon) > 0$  topilib  $|y - y_0| < \delta$ ,  $|y' - y_0| < \delta$  tengsizliklarni qanoatlantiruvchi  $\forall y, y' \in E$  hamda  $\forall x \in [a, b]$  uchun

$$|f(x, y) - f(x, y')| < \varepsilon \quad (16.1)$$

tengsizlikning bajarilishi zarur va yetarli.

◀ Zarurligi.  $f(x, y)$  funksiya  $y \rightarrow y_0$  da  $\varphi(x)$  limit funksiyaga ega bo'lib, unga  $[a, b]$  da tekis yaqinlashsin. Ta'rifga ko'ra,  $\forall \varepsilon > 0$  olinganda ham,  $\frac{\varepsilon}{2}$  ga ko'ra shunday  $\delta = \delta(\varepsilon) > 0$  topildiki.  $|y - y_0| < \delta$  tengsizlikni qanoatlantiruvchi  $\forall y \in E$  hamda  $\forall x \in [a, b]$  uchun  $|f(x, y) - \varphi(x)| < \frac{\varepsilon}{2}$  bo'ladi. Jumladan

$|y' - y_0| < \delta \Rightarrow |f(x, y') - \varphi(x)| < \frac{\varepsilon}{2}$  bo'ladi. Natijada

$|f(x, y) - f(x, y')| \leq |f(x, y) - \varphi(x)| + |f(x, y') - \varphi(x)| < \varepsilon$  bo'lib, undan (16.1) shartning bajarilishini topamiz.

*Yetartiligi.* Teoremadagi (16.1) shart bajarilsin. U holda  $x$  o'zgaruvchining  $[a, \sigma]$  oraliqda olingan har bir tayin qiymatida  $f(x, y)$  funksiya  $y$  o'zgaruvchininggina funksiyasi bo'lub,  $\forall \varepsilon > 0$  olinganda ham, shunday  $\delta = \delta(\varepsilon) > 0$  topiladiki.  $|y - y_0| < \delta$ ,  $|y' - y_0| < \delta$  tengsizliklarni qanoatlantiruvchi  $\forall y, y' \in E$  uchun

$$|f(x, y) - f(x, y')| < \varepsilon \quad (16.2)$$

bo'ladi. Funksiya limitining mavjudligi haqidagi Koshi teoremasiga asosan (qaralsin, 1-qism, 4-bob, 6-§)  $y \rightarrow y_0$  da  $f(x, y)$  funksiya limitga ega bo'ladi. Ravshanki, bu limit tayinlangan  $x$  ( $x \in [a, \sigma]$ ) ga bog'liq. Demak,

$$\lim_{y \rightarrow y_0} f(x, y) = \varphi(x).$$

Shu bilan  $y \rightarrow y_0$  da  $f(x, y)$  funksiya  $\varphi(x)$  limit funksiyaga ega bo'lishi ko'rsatildi.

Endi  $y$  o'zgaruvchini  $|y - y_0| < \delta$  tengsizlikni qanoatlantiradigan qiymatda tayinlab, (16.2) tengsizlikda  $y' \rightarrow y_0$  da limitga o'tsak, u holda

$$|f(x, y) - \varphi(x)| \leq \varepsilon$$

hosil bo'ladi. Bu esa  $y \rightarrow y_0$  da  $f(x, y)$  funksiyaning  $\varphi(x)$  limit funksiyaga  $[a, \sigma]$  da tekis yaqinlashishini bildiradi. ▶

Endi limit funksiyaning uzluksizligi haqidagi teoremani keltiraylik. Bu teoremadan kelgusida ko'p foydalanamiz.

**2-teorema.** Agar  $f(x, y)$  funksiya  $y$  o'zgaruvchining  $E$  to'plamidan olingan har bir qiymatida,  $x$  o'zgaruvchining funksiyasi sifatida,  $[a, \sigma]$  oraliqda uzluksiz bo'lsa va  $y \rightarrow y_0$  da  $f(x, y)$  funksiya  $\varphi(x)$  limit funksiyaga  $[a, \sigma]$  da tekis yaqinlashsa, u holda  $\varphi(x)$  funksiya  $[a, \sigma]$  da uzluksiz bo'ladi.

◀  $y_0$  ga intiladigan  $\{y_n\}$  ketma-ketlikni olaylik ( $y_n \in E$ ,  $n = 1, 2, \dots$ ). Shartga ko'ra har bir  $y_n$  ( $n = 1, 2, \dots$ ) da  $f(x, y_n)$  funksiya  $x$  o'zgaruvchining  $[a, \sigma]$  oraliqdagi uzluksiz funksiyasi bo'ladi. Demak,  $\{f(x, y_n)\}$  funksional ketma-ketlikning har bir hadi  $[a, \sigma]$  oraliqda uzluksiz.

Teoremaning ikkinchi shartiga ko'ra  $\forall \varepsilon > 0$  olinganda ham, shunday  $\delta = \delta(\varepsilon) > 0$  topiladiki,  $\forall x \in [a, \sigma]$  uchun

$$|y - y_0| < \delta \Rightarrow |f(x, y) - \varphi(x)| < \varepsilon \quad (y \in E) \quad (16.3)$$

bo'ladi.

$y_n \rightarrow y_0$  dan yuqorida olingan  $\delta = \delta(\varepsilon) > 0$  ga ko'ra shunday  $n_0 \in N$  topiladiki,  $\forall n > n_0$  uchun  $|y_n - y_0| < \delta$  bo'ladi. U holda, (16.3) ga asosan,  $\forall \varepsilon > 0$  olinganda ham shunday  $n_0 \in N$  topiladiki,  $\forall n > n_0$  va  $\forall x \in [a, \sigma]$  uchun

$$|f(x, y_n) - \varphi(x)| < \varepsilon$$

bo'ladi. Bu esa  $\{f(x, y_n)\}$  funksional ketma-ketlik  $\varphi(x)$  ga  $[a, \sigma]$  da tekis yaqinlashuvchiligini bildiradi. 14-bob. 3-§ da keltirilgan 6-teoremaga asosan  $\varphi(x)$  funksiya  $[a, \sigma]$  oraliqda uzluksizdir. ▶

## 2-§. Parametrga bog'liq integrallar

$f(x, y)$  funksiya

$$M = \{(x, y) \in R^2 : x \in [a, \epsilon], y \in E \subset R\}$$

to'plamda berilgan bo'lib.  $y$  o'zgaruvchining  $E$  to'plamidan olingan har bir tayin qiymatida  $f(x, y)$   $x$  o'zgaruvchining funksiyasi sifatida  $[a, \epsilon]$  oraliqda integrallanuvchi, ya'ni

$$\int f(x, y) dx$$

integral mavjud bo'lsin. Ravshanki, bu integralning qiymati olingan  $y$  ga bog'liq bo'ladi:

$$\Phi(y) = \int f(x, y) dx. \quad (16.4)$$

Odatda (16.4) parametrga bog'liq integral, y o'zgaruvchi esa parametr deyiladi.

Ushbu paragrafda parametrga bog'liq (16.4) integralning  $(\Phi(y))$ -funksiyaning funksional xossalarni o'rGANAMIZ.

**1º. Integral belgisi ostida limitga o'tish.**  $f(x, y)$  funksiya  $M = \{(x, y) \in R^2 : x \in [a, \epsilon], y \in E \subset R\}$  to'plamda berilgan bo'lib.  $y_0$  nuqta  $E$  to'plamning limit nuqtasi bo'lsin.

**3-teorema.**  $f(x, y)$  funksiya  $y$  ning  $E$  to'plamdan olingan har bir tayin qiymatida  $x$  ning funksiyasi sifatida  $[a, \epsilon]$  oraliqda uzuksiz bo'lsin. Agar  $f(x, y)$  funksiya  $y \rightarrow y_0$  da  $\varphi(x)$  limit funksiyaga ega bo'lsa va unga tekis yaqinlashsa, u holda

$$\lim_{y \rightarrow y_0} \int_a^x f(x, y) dy = \int_a^x \varphi(x) dx \quad (16.5)$$

bo'ladi.

◀ Shartga ko'ra  $f(x, y)$  funksiya  $y \rightarrow y_0$  da  $\varphi(x)$  limit funksiyaga ega va unga tekis yaqinlashadi. Demak,  $\forall \epsilon > 0$  olinganda ham shunday  $\delta = \delta(\epsilon) > 0$  topiladiki,  $|y - y_0| < \delta$  ni qanoatlantiruvchi  $\forall y \in E$  va  $\forall x \in [a, \epsilon]$  uchun

$$|f(x, y) - \varphi(x)| < \frac{\epsilon}{\epsilon - a}$$

bo'ladi.

Ikkinchi tomonidan, 2-teoremaga asosan,  $\varphi(x)$  funksiya  $[a, \epsilon]$  oraliqda uzuksiz bo'ladi. Demak, bu funksiyaning integrali  $\int_a^x \varphi(x) dx$  mavjud.

Natijada

$$\left| \int_a^x f(x, y) dy - \int_a^x \varphi(x) dx \right| \leq \int_a^x |f(x, y) - \varphi(x)| dy < \frac{\epsilon}{\epsilon - a} \int_a^x dy = \epsilon$$

bo'lib, undan

$$\lim_{y \rightarrow y_0} \int_a^b f(x, y) dx = \int_a^b \phi(x) dx$$

ekanligi kelib chiqadi. ►

(16.5) munosabatni quyidagicha

$$\lim_{y \rightarrow y_0} \int_a^b f(x, y) dx = \int_a^b \left( \lim_{y \rightarrow y_0} f(x, y) \right) dx$$

ham yozish mumkin. Bu esa integral belgisi ostida limitga o'tish mumkinligini ko'rsatadi.

**2°. Integralning parametr bo'yicha uzlucksizligi.**

**4-teorema.** Agar  $f(x, y)$  funksiya

$$M = \{(x, y) \in R^2 : x \in [a, b], y \in [c, d]\}$$

to'plamda uzlucksiz bo'lsa, u holda

$$\Phi(y) = \int_a^b f(x, y) dx$$

funksiya  $[c, d]$  oraliqda uzlucksiz bo'ladi.

◀ Ixtiyoriy  $y_0 \in [c, d]$  nuqtani olaylik. Shartga ko'ra  $f(x, y)$  funksiya  $M$  to'plamda (to'g'ri to'rtburchakda) uzlucksiz. Kantor teoremasiga ko'ra bu funksiya  $M$  to'plamda tekis uzlucksiz bo'ladi. Unda  $\forall \varepsilon > 0$  olinganda ham, shunday  $\delta = \delta(\varepsilon) > 0$  topiladi,

$$\rho((x, y)(x, y_0)) = |y - y_0| < \delta$$

tengsizlikni qanoatlaniruvchi  $\forall (x, y) \in M, \forall (x, y_0) \in M$  uchun

$$|f(x, y) - f(x, y_0)| < \varepsilon$$

bo'ladi. Bu esa  $f(x, y)$  funksiya  $y \rightarrow y_0$  da  $f(x, y_0)$  limit funksiyaga tekis yaqinlashishini bildiradi. U holda 3-teoremgaga asosan

$$\lim_{y \rightarrow y_0} \Phi(y) = \lim_{y \rightarrow y_0} \int_a^b f(x, y) dx = \int_a^b \left( \lim_{y \rightarrow y_0} f(x, y) \right) dx = \int_a^b f(x, y_0) dx = \Phi(y_0)$$

$(\forall y_0 \in [c, d])$

bo'ladi. Demak,  $\Phi(y)$  funksiya  $y_0$  nuqtada uzlucksiz. ►

**3°. Integralni parametr bo'yicha differensiallash.** Endi parametrga bog'liq integralni parametri bo'yicha differensiallashni qaraymiz.

**5-teorema.**  $f(x, y)$  funksiya

$$M = \{(x, y) \in R^2 : x \in [a, b], y \in [c, d]\}$$

to'plamda berilgan va  $y$  o'zgaruvchining  $[c, d]$  oraliqdan olinigan har bir tayin qiymatida  $x$  o'zgaruvchining funksiyasi sifatida  $[a, b]$  oraliqda uzlucksiz bo'lsin. Agar  $f(x, y)$  funksiya  $M$  to'plamda  $f'_y(x, y)$  xususiy hosilaga ega bo'lib, u uzlucksiz bo'lsa, u holda  $\Phi(y)$  funksiya ham  $[c, d]$  oraliqda  $\Phi'(y)$  hosilaga ega va ushbu

$$\Phi'(y) = \int_a^b f'_y(x, y) dx$$

munosabat o'tinlidir.

► Shartga ko'ra  $f(x, y)$  funksiya  $x$  o'zgaruvchisi bo'yicha  $[a, b]$  oraliqda uzlaksiz. Binobarin,

$$\Phi(y) = \int_a^y f(x, y) dx$$

integral mavjud.

Endi  $\forall y_0 \in [c, d]$  nuqtani olib, unga shunday  $\Delta y (\Delta y \geq 0)$  orttirma beraylikki,  $y_0 + \Delta y \in [c, d]$  bo'lsin.  $\Phi(y)$  funksiyaning  $y_0$  nuqtadagi orttirmasini topib, ushbu

$$\frac{\Phi(y_0 + \Delta y) - \Phi(y_0)}{\Delta y} = \int_a^{y_0 + \Delta y} f(x, y_0 + \Delta y) - f(x, y_0) dx$$

tenglikni hosil qilamiz. Lagranj teoremasi (1-qism, 6-bob, 6-§) ga ko'ra

$$\frac{f(x, y_0 + \Delta y) - f(x, y_0)}{\Delta y} = f'_y(x, y_0 + \theta \Delta y)$$

bo'ladi, bunda  $0 < \theta < 1$ .

Natijada

$$\begin{aligned} \frac{\Phi(y_0 + \Delta y) - \Phi(y_0)}{\Delta y} &= \int_a^{y_0 + \Delta y} f'_y(x, y_0 + \theta \Delta y) dx = \int_a^{y_0} f'_y(x, y_0) dx + \\ &\quad + \int_a^{y_0 + \Delta y} [f'_y(x, y_0 + \theta \Delta y) - f'_y(x, y_0)] dx \end{aligned}$$

bo'lub, undan esa

$$\begin{aligned} \left| \frac{\Phi(y_0 + \Delta y) - \Phi(y_0)}{\Delta y} - \int_a^{y_0} f'_y(x, y_0) dx \right| &\leq \int_a^{y_0 + \Delta y} |f'_y(x, y_0 + \theta \Delta y) - f'_y(x, y_0)| dx \leq \\ &\leq \int_a^{y_0 + \Delta y} \omega(f'_y, \Delta y) dx = \omega(f'_y, \Delta y) \cdot (b - a) \end{aligned} \tag{16.7}$$

ba'lishini topamiz, bunda  $\omega(f'_y, \Delta y) - f'_y(x, y)$  funksiyaning uzlaksizlik moduli.

Modomiki,  $f'_y(x, y)$  funksiya  $M$  to'plamda uzlaksiz ekan, unda Kantor teoremasiga ko'ra bu funksiya shu to'plamda tekis uzlaksiz bo'ladi. U holda 1-qism, 5-bob, 9-§ da, keltirilgan teoremaaga asosan

$$\lim_{\Delta y \rightarrow 0} \omega(f'_y, \Delta y) = 0$$

bo'ladi.

(16.7) munosabatdan

$$\lim_{\Delta y \rightarrow 0} \frac{\Phi(y_0 + \Delta y) - \Phi(y_0)}{\Delta y} = \int_a^{y_0} f'_y(x, y_0) dx$$

bo'lishi kelib chiqadi. Demak,

$$\Phi'(y_0) = \int_a^{y_0} f'_y(x, y_0) dx.$$

Qaralayotgan  $y_0$  nuqta  $[c, d]$  oraliqning ixtiyoriy nuqtasi bo'lganligini e'tiborga olsak, unda keyingi tenglik teoremaning isbotlanganligini ko'rsatadi. ► (16.6) munosabatni quyidagicha ham yozish mumkin:

$$\frac{d}{dy} \int_a^b f(x, y) dx = \int_a^b \left( \frac{\partial}{\partial y} f(x, y) \right) dx$$

Bu esa differensiallash amalini integral belgisi ostida o'tkazish mumkinligini ko'rsatadi.

Isbot etilgan bu 5-teorema Leybnits qoidasi deb ataladi.

**4°. Integralni parametr bo'yicha integrallash.**  $f(x, y)$  funksiya  $M = \{(x, y) \in R^2 : x \in [a, b], y \in [c, d]\}$  to'plamda berilgan va shu to'plamda uzliksiz bo'lсин. U holda 4-teoremagaga ko'ra

$$\Phi(y) = \int_a^b f(x, y) dx$$

funksiya  $[c, d]$  oraliqda uzliksiz bo'ladi. Binobarin bu funksiyaning  $[c, d]$  oraliq bo'yicha integrali mavjud.

Demak,  $f(x, y)$  funksiya  $M$  to'plamda uzliksiz bo'lsa, u holda parametrga bog'liq integralini parametr bo'yicha  $[c, d]$  oraliqda integrallash mumkin:

$$\int_c^d \Phi(y) dy = \int_c^d \left( \int_a^b f(x, y) dx \right) dy.$$

Bu tenglikning o'ng tomonida  $f(x, y)$  funksiyani avval  $x$  o'zgaruvchi bo'yicha  $[a, b]$  oraliqda integrallab (bunda  $y$  ni o'zgartarmas hisoblab), so'ng natijani  $[c, d]$  oraliqda integrallanadi.

Ba'zan  $f(x, y)$  funksiya  $M$  to'plamda uzliksiz bo'lgan holda bu funksiyani avval  $y$  o'zgaruvchisi bo'yicha  $[c, d]$  oraliqda integrallab (bunda  $x$  ni o'zgartarmas hisoblab), so'ng hosil bo'lgan  $x$  o'zgaruvchining funksiyasini  $[a, b]$  oraliqda integrallash qulay bo'ladi. Natijada ushbu

$$\int_c^d \left( \int_a^b f(x, y) dx \right) dy, \quad \int_a^b \left( \int_c^d f(x, y) dy \right) dx$$

integrallar hosil bo'ladi. Bu integrallar bir-biriga teng bo'ladimi degan savol tug'iladi. Bu savolga quyidagi teorema javob beradi.

**6-teorema.** Agar  $f(x, y)$  funksiya  $M = \{(x, y) \in R^2 : x \in [a, b], y \in [c, d]\}$  to'plamda uzliksiz bo'lsa, u holda

$$\int_c^d \left( \int_a^b f(x, y) dx \right) dy = \int_a^b \left( \int_c^d f(x, y) dy \right) dx$$

bo'ladi.

◀  $\forall t \in [c, d]$  nuqtani olib, quyidagi

$$w(t) = \int_a^b \left( \int_c^t f(x, y) dy \right) dx, \quad v(t) = \int_c^t \left( \int_a^b f(x, y) dx \right) dy$$

integrallarni qaraylik. Bu  $\varphi(t)$ ,  $\psi(t)$  funksiyalarning hosilalarini hisoblaymiz.

$\Phi(y) = \int f(x, y) dx$  funksiya  $[c, d]$  oraliqda uzlusiz bo'lgani sababli 1-qism, 9-bob, 6-§ da keltirilgan 9-teoremaga asosan

$$\varphi'(t) = \left( \int \Phi(y) dy \right)' = \Phi(t) = \int f(x, t) dx \quad (16.8)$$

bo'ladi.

$f(x, y)$  funksiya  $M$  to'plamda uzlusiz. Yana usha 1-qism. 9-bob, 6-§ dagi teoremaga ko'ra

$$\left( \int f(x, y) dy \right)' = f(x, t) \quad (x o'zgarmas)$$

bo'ladi. Demak,  $\int f(x, y) dy$  funksiyaning  $M = \{(x, t) \in R^2 : x \in [a, s], t \in [c, d]\}$  to'plamdagidagi  $t$  bo'yicha xususiy hosilasi  $f(x, t)$  ga teng va demak, uzlusiz. U holda 5-teoremaga muvofiq

$$\psi'(t) = \left[ \int_a^t \left( \int f(x, y) dy \right) dx \right]' = \int_a^t \left( \int f(x, y) dy \right)' dx = \int_a^t f(x, t) dx \quad (16.9)$$

bo'ladi.

(16.8) va (16.9) munosabatlardan

$$\varphi'(t) = \psi'(t) = \int f(x, t) dx$$

bo'lishi kelib chiqdi. Demak,

$$\varphi(t) = \psi(t) + C, \quad (C = const).$$

Ayni paytda  $t = c$  bo'lganda  $\varphi(c) = \psi(c) = 0$  bo'lib, undan  $C = 0$  bo'lishini topamiz. Demak,  $\varphi(t) = \psi(t)$  bo'ladi. Xususan,  $t = d$  bo'lganda  $\varphi(d) = \psi(d) = 0$  bo'lib, u teoremani isbotlaydi. ►

**16.2-misol.** Parametrga bog'liq integralni parametr bo'yicha integrallashdan foydalanib, ushbu

$$A = \int_0^1 \frac{x^a - x^a}{\ln x} dx \quad (0 < a < s)$$

integral hisoblansin.

◀ Ravshanki. ( $x > 0$ )

$$\int x^y dy = \frac{x^y - x^y}{\ln x}$$

bo'ladi. Demak,

$$A = \int_0^1 \frac{x^y - x^y}{\ln x} dx = \int_0^1 \left( \int x^y dy \right) dx.$$

Integral ostidagi  $f(x, y) = x^y$  funksiya  $M = \{(x, y) \in R^2 : x \in [0, 1], y \in [a, b]\}$  to'plamda uzliksizdir. U holda 6-teorema ko'ra

$$A = \int_a^b \left( \int_0^1 x^y dx \right) dy$$

bo'ladi. Ravshanki.

$$\int_0^1 x^y dx = \frac{1}{y+1}.$$

Unda  $A = \int_a^b \frac{dy}{y+1} = \ln \frac{a+1}{a+1}$  bo'ladi. Demak,

$$\int_0^1 \frac{x^a - x^b}{\ln x} dx = \ln \frac{a+1}{a+1} \rightarrow$$

**5<sup>o</sup>. Chegaralari ham parametriga bog'liq integrallar.**  $f(x, y)$  funksiya  $M = \{(x, y) \in R^2 : x \in [a, b], y \in [c, d]\}$  to'plamda berilgan.  $y$  o'zgaruvchining  $[c, d]$  oraliqidan olingan har bir tayin qiymatida  $f(x, y)$  funksiya  $x$  o'zgaruvchining funksiyasi sifatida  $[a, b]$  oraliqda integrallanuvchi bo'lsin.

$x = \alpha(y)$ ,  $x = \beta(y)$  funksiyalarning har biri  $[c, d]$  da berilgan va  $\forall y \in [c, d]$  uchun ushbu

$$a \leq \alpha(y) \leq \beta(y) \leq b \quad (16.9)$$

tengsizlikni qanoatlantirsin.

Ravshanki, ushbu

$$\int_{\alpha(y)}^{\beta(y)} f(x, y) dx$$

integral mavjud,  $y$  o'zgaruvchi (parametr)ga bog'liqdir:

$$F(y) = \int_{\alpha(y)}^{\beta(y)} f(x, y) dx. \quad (16.10)$$

**7-teorema.**  $f(x, y)$  funksiya  $M = \{(x, y) \in R^2 : x \in [a, b], y \in [c, d]\}$  to'plamda uzliksiz,  $\alpha(y)$  va  $\beta(y)$  funksiyalarning har biri  $[c, d]$  da uzliksiz va ular (16.9) shartni qanoatlantirsin. U holda

$$F(y) = \int_{\alpha(y)}^{\beta(y)} f(x, y) dx$$

funksiya ham  $[c, d]$  oraliqda uzliksiz bo'ladi.

◀  $\forall y_0 \in [c, d]$  nuqtani olib, unga shunday  $\Delta y$  ( $\Delta y \geq 0$ ) ortirma beraylikki,  $y_0 + \Delta y \in [c, d]$  bo'lsin. U holda

$$\begin{aligned} F(y_0 + \Delta y) - F(y_0) &= \int_{\alpha(y_0 + \Delta y)}^{\beta(y_0 + \Delta y)} f(x, y_0 + \Delta y) dx - \int_{\alpha(y_0)}^{\beta(y_0)} f(x, y_0) dx = \\ &= \int_{\alpha(y_0)}^{\beta(y_0 + \Delta y)} [f(x, y_0 + \Delta y) - f(x, y_0)] dx + \int_{\beta(y_0)}^{\beta(y_0 + \Delta y)} f(x, y_0 + \Delta y) dx - \int_{\alpha(y_0)}^{\beta(y_0)} f(x, y_0) dx \end{aligned} \quad (16.11)$$

bo'ldi. Bu tenglikning o'ng tomonidagi qo'shiluvchilarni baholaymiz.

$f(x, y)$  funksiya  $M$  to'plamda uzlusiz, demak. Kantor teoremasiga asosan, tekis uzlusiz bo'ldi. U holda  $\Delta y \rightarrow 0$  da  $f(x, y_0 + \Delta y)$  funksiya o'z limit funksiyasi  $f(x, y_0)$  ga tekis yaqinlashadi va 16.3-teoremaga ko'ra

$$\lim_{\Delta y \rightarrow 0} \int_{\alpha(y_0)}^{\beta(y_0)} [f(x, y_0 + \Delta y) - f(x, y_0)] dx = \int_{\alpha(y_0)}^{\beta(y_0)} [f(x, y_0 + \Delta y) - f(x, y_0)] dx = 0 \quad (16.12)$$

bo'ldi.

(16.11) munosabatdagi

$$\int_{\alpha(y_0)}^{\beta(y_0 + \Delta y)} f(x, y_0 + \Delta y) dx, \quad \int_{\alpha(y_0)}^{\alpha(y_0 + \Delta y)} f(x, y_0 + \Delta y) dx$$

integrallar uchun quyidagi bahoga egamiz:

$$\left| \int_{\beta(y_0)}^{\beta(y_0 + \Delta y)} f(x, y_0 + \Delta y) dx \right| \leq M_0 |\beta(y_0 + \Delta y) - \beta(y_0)|, \quad (16.13)$$

$$\left| \int_{\alpha(y_0)}^{\alpha(y_0 + \Delta y)} f(x, y_0 + \Delta y) dx \right| \leq M_0 |\alpha(y_0 + \Delta y) - \alpha(y_0)|,$$

bunda  $M_0 = \sup \{f(x, y) | (x, y) \in M\}$ .

Shartga ko'ra  $\alpha(y), \beta(y)$  funksiyalarning har biri  $[c, d]$  da uzlusiz. Demak,

$$\lim_{\Delta y \rightarrow 0} [\alpha(y_0 + \Delta y) - \alpha(y_0)] = 0, \quad (16.14)$$

$$\lim_{\Delta y \rightarrow 0} [\beta(y_0 + \Delta y) - \beta(y_0)] = 0$$

Yuqoridagi (16.12), (16.13) va (16.14) munosabatlarni e'tiborga olib, (16.11) tenglikda  $\Delta y \rightarrow 0$  da limitiga o'tsak, unda

$$\lim_{\Delta y \rightarrow 0} [F(y_0 + \Delta y) - F(y_0)] = 0$$

bo'lishi kelib chiqadi. Demak,  $F(y)$  funksiya  $\forall y_0 \in [c, d]$  da uzlusiz. ▶

**8-teorema**  $f(x, y)$  funksiya  $M = \{(x, y) \in R^2 : x \in [a, b], y \in [c, d]\}$  to'plamda uzlusiz,  $f'_y(x, y)$  xususiy hosilaga ega va u uzlusiz,  $\alpha(y), \beta(y)$  funksiyalar esa  $\alpha'(y), \beta'(y)$  hosilalarga ega hamda ular (16.9) shartni qanoatlantirsin. U holda

$$F(y) = \int_{\alpha(y)}^{\beta(y)} f(x, y) dx$$

funksiya  $[c, d]$  oraliqda  $F'(y)$  hosilaga ega va

$$F'(y) = \int_{\alpha(y)}^{\beta(y)} f'_y(x, y) dx + \beta'(y) \cdot f(\beta(y), y) - \alpha'(y) \cdot f(\alpha(y), y)$$

bo'ldi.

◀  $\forall y_0 \in [c, d]$  nuqtani olib, unga shunday  $\Delta y$  ( $\Delta y < 0$ ) orttirma beraylikki,  $y_0 + \Delta y \in [c, d]$  bo'lsin.

(16.11) munosabatdan foydalanib quyidagini topamiz:

$$\begin{aligned} \frac{F(y_0 + \Delta y) - F(y_0)}{\Delta y} &= \frac{\int_{\alpha(y_0)}^{\beta(y_0)} f(x, y_0 + \Delta y) - f(x, y_0) dx}{\Delta y} + \\ &+ \frac{1}{\Delta y} \int_{\alpha(y_0)}^{\beta(y_0 + \Delta y)} f(x, y_0 + \Delta y) dx - \frac{1}{\Delta y} \int_{\alpha(y_0)}^{\alpha(y_0 + \Delta y)} f(x, y_0 + \Delta y) dx. \end{aligned} \quad (16.15)$$

$\Delta y \rightarrow 0$  da

$$\frac{f(x, y_0 + \Delta y) - f(x, y_0)}{\Delta y}$$

funksiya o'z limit funksiyasi  $f'_y(x, y_0)$  ga  $[a, b]$  oraliqda tekis yaqinlashadi. (Unda

$$\lim_{\Delta y \rightarrow 0} \int_{\alpha(y_0)}^{\beta(y_0 + \Delta y)} \frac{f(x, y_0 + \Delta y) - f(x, y_0)}{\Delta y} dx = \int_{\alpha(y_0)}^{\beta(y_0)} f'_y(x, y_0) dx \quad (16.16)$$

bo'ladi.

Endi

$$\int_{\alpha(y_0)}^{\beta(y_0 + \Delta y)} f(x, y_0 + \Delta y) dx, \quad \int_{\alpha(y_0)}^{\alpha(y_0 + \Delta y)} f(x, y_0 + \Delta y) dx$$

integrallarga o'rta qiymat haqidagi teoremani qo'llab (qaralsin. 1-qism, 9-bob, 5-§), ushbu

$$\begin{aligned} \int_{\alpha(y_0)}^{\beta(y_0 + \Delta y)} f(x, y_0 + \Delta y) dx &= f(x', y_0 + \Delta y) [\beta(y_0 + \Delta y) - \beta(y_0)], \\ \int_{\alpha(y_0 + \Delta y)}^{\beta(y_0)} f(x, y_0 + \Delta y) dx &= f(x'', y_0 + \Delta y) [\alpha(y_0 + \Delta y) - \alpha(y_0)] \end{aligned}$$

tengliklarni hosil qilamiz, bunda  $x'$  nuqta  $\beta(y_0)$ ,  $\beta(y_0 + \Delta y)$  nuqtalar orasida,  $x''$  esa  $\alpha(y_0)$ ,  $\alpha(y_0 + \Delta y)$  nuqtalar orasida joylashgan.

$f(x, y)$  funksiyaning  $M$  ta'plamda uzluksizligini,  $\alpha(y)$  va  $\beta(y)$  funksiyalarning esa  $[c, d]$  oraliqda hosilaga ega bo'lishini e'tiborga olsak, u holda

$$\begin{aligned} \lim_{\Delta y \rightarrow 0} \frac{1}{\Delta y} \int_{\alpha(y_0)}^{\beta(y_0 + \Delta y)} f(x, y_0 + \Delta y) dx &= \lim_{\Delta y \rightarrow 0} \left[ f'(x', y_0 + \Delta y) \frac{\beta(y_0 + \Delta y) - \beta(y_0)}{\Delta y} \right] - \\ &= f(\beta(y_0), y_0) \beta'(y_0) \\ \lim_{\Delta y \rightarrow 0} \frac{1}{\Delta y} \int_{\alpha(y_0 + \Delta y)}^{\alpha(y_0)} f(x, y_0 + \Delta y) dx &= \lim_{\Delta y \rightarrow 0} \left[ f'(x'', y_0 + \Delta y) \frac{\alpha(y_0 + \Delta y) - \alpha(y_0)}{\Delta y} \right] = \\ &= f(\alpha(y_0), y_0) \alpha'(y_0) \end{aligned} \quad (16.17)$$

ekanligi kelib chiqadi.

Yuqoridagi (16.15) munosabatda,  $\Delta y \rightarrow 0$  da limitga o'tib, (16.16) va (16.17) tengliklarni e'tiborga olib ushbuni topamiz:

$$\begin{aligned} \lim_{\Delta y \rightarrow 0} \frac{F(y_0 + \Delta y) - F(y_0)}{\Delta y} &= \int_{\alpha(y_0)}^{\beta(y_0)} f'_y(x, y_0) dx + f(\beta(y_0), y_0) \beta'(y_0) - \\ &- f(\alpha(y_0), y_0) \alpha'(y_0) \end{aligned}$$

Demak,

$$F'(y_0) = \int_{\alpha(y_0)}^{\beta(y_0)} f'_y(x, y_0) dx + f(\beta(y_0), y_0) \cdot \beta'(y_0) - f(\alpha(y_0), y_0) \cdot \alpha'(y_0)$$

Modomiki,  $y_0$  nuqta  $[c, d]$  oraliqdagi ixtiyoriy nuqta ekan, u holda  $\forall y \in [c, d]$  uchun

$$F'(y) = \int_{\alpha(y)}^{\beta(y)} f'_y(x, y) dx + f(\beta(y), y) \cdot \beta'(y) - f(\alpha(y), y) \cdot \alpha'(y)$$

bo'lishi ravshandir. ▶

### 3-§. Parametrga bog'liq xosmas integrallar. Integrallarning tekis yaqinlashishi

I<sup>o</sup>. Parametrga bog'liq xosmas integral tushunchasi.  $f(x, y)$  funksiya  $M = \{(x, y) \in R^2 : x \in [a, +\infty), y \in E \subset R\}$  to'plamda berilgan. So'ng  $y$  o'zgaruvchining  $E$  to'plamdan olingan har bir tayin qiymatida  $f(x, y)$   $x$  o'zgaruvchining funksiyasi sifatida  $[a, +\infty)$  oraliq bo'yicha integrallanuvchi, ya'ni

$$\int_a^{\infty} f(x, y) dx \quad (y \in E \subset R)$$

xosmas integral mavjud va chekli bo'lsin. Bu integral  $y$  ning qiymatiga bog'liqidir:

$$J(y) = \int_a^{\infty} f(x, y) dx. \quad (16.18)$$

(16.18) integral parametrga bog'liq cheksiz oraliq bo'yicha xosmas integral deb ataladi.

$f(x, y)$  funksiya  $M_1 = \{(x, y) \in R^2 : x \in [a, \epsilon], y \in E \subset R\}$  to'plamda berilgan. So'ng  $y$  o'zgaruvchining  $E$  to'plamdan olingan har bir tayin qiymatida  $f(x, y)$  ni  $x$  o'zgaruvchining funksiyasi sifatida qaralganda uning uchun  $x = \epsilon$  maxsus nuqta bo'lsin va bu funksiya  $[a, \epsilon]$  oraliqda integrallanuvchi, ya'ni,

$$\int_a^{\epsilon} f(x, y) dx \quad (y \in E \subset R)$$

xosmas integral mavjud bo'lsin. Ravshanki, bu integral  $y$  ning qiymatiga bog'liq:

$$J_1(y) = \int_a^{\epsilon} f(x, y) dx. \quad (16.19)$$

(16.19) integral parametrga bog'liq, chegaralanmagan funksiyaning xosmas integrali deb ataladi.

Masalan, 15-bobning I-§ ida qaralgan

$$J(a) = \int_a^{\infty} \frac{dx}{x^{\alpha}} \quad (a > 0, \alpha > 0)$$

integral, shu bobning 5-§ ida qaralgan

$$\int \frac{dx}{(x-a)^a}, \int \frac{dx}{a(x-a)^a} \quad (a > 0)$$

integrallar, 15-bohnning 9-§ da qaralgan

$$\Gamma(a) = \int_0^\infty x^{a-1} e^{-x} dx$$

integrallar parametrga bog'liq xosmas integrallardir.

Bu erda ham asosiy masalalardan biri -  $f(x, y)$  funksiyaning funksional xossalariiga ko'ra. (16.18), (16.19) parametrlariga bog'liq xosmas integralarning funksional xossalariini o'rGANISHdir.

Parametrlarga bog'liq xosmas integralarni o'rGANISHda integralning tekis yaqinlashishi tushunchas muhim rol o'yndaydi.

**2º. Integralning tekis yaqinlashishi.**  $f(x, y)$  funksiya  $M = \{(x, y) \in R^2 : x \in [a, +\infty), y \in E \subset R\}$  to'plamda berilgan.  $y$  o'zgaruvchining  $E$  to'plamidan olingan har bir tayin qiymatida  $f(x, y)$   $x$  o'zgaruvchining funksiyasi sifatida  $[a, +\infty)$  da integrallanuvchi bo'lsin.

Cheksiz oraliq bo'yicha xosmas integral ta'rifiga ko'ra ixtiyoriy  $[a, t]$  da ( $a < t < +\infty$ )

$$F(t, y) = \int_a^t f(x, y) dx \quad (16.20)$$

integral mavjud va

$$J(y) = \lim_{t \rightarrow +\infty} F(t, y). \quad (16.21)$$

Shunday qilib, (16.20) va (16.21) integrallar bilan aniqlangan  $F(t, y)$  va  $J(y)$  funksiyalarga ega bo'lamiz va  $J(y)$  funksiya  $F(t, y)$  funksiyaning  $t \rightarrow +\infty$  dagi limit funksiyasi bo'ladi.

**5-ta'rif.** Agar  $t \rightarrow +\infty$  da  $F(t, y)$  funksiya o'z limit funksiyasi  $J(y)$  ga  $E$  to'plamda tekis yaqinlashsa,

$$J(y) = \int_a^\infty f(x, y) dx$$

integral  $E$  to'plamda tekis yaqinlashuvchi deb ataladi.

**6-ta'rif.** Agar  $t \rightarrow +\infty$  da  $F(t, y)$  funksiya o'z limit funksiya  $J(y)$  ga  $E$  da notebris yaqinlashsa,

$$J(y) = \int_a^\infty f(x, y) dx$$

integral  $E$  to'plamda notebris yaqinlashuvchi deb ataladi.

Ravshanki,  $\int f(x, y) dx$  integral  $E$  to'plamda tekis yaqinlashuvchi bo'lsa, u shu to'plamda yaqinlashuvchi bo'ladi.

Shunday qilib,

$$\int_a^x f(x,y)dx$$

integralning  $E$  to'plamda tekis yaqinlashuvchi bo'lishi quyidagini anglatadi:

- 1)  $\int_a^x f(x,y)dx$  xosmas integral y o'zgaruvchining  $E$  to'plamdan olingan har bir tayin qiymatida yaqinlashuvchi;
- 2)  $\forall \varepsilon > 0$  olinganda ham, shunday  $\delta = \delta(\varepsilon) > 0$  topiladiki,  $\forall t > \delta$  va  $\forall y \in E$  uchun

$$\left| \int_t^x f(x,y)dx \right| < \varepsilon$$

bo'ladi.

$\int_a^x f(x,y)dx$  integral  $E$  to'plamda yaqinlashuvchi, ammo u shu to'plamda notejis yaqinlashuvchi degani quyidagini anglatadi:

- 1)  $\int_a^x f(x,y)dx$  xosmas integral y o'zgaruvchining  $E$  to'plamdan olingan har bir tayin qiymatida yaqinlashuvchi;
- 2)  $\forall \delta > 0$  olinganda ham, shunday  $\varepsilon_0 > 0$ ,  $y_0 \in E$  va  $t_1 > \delta$  tengsizlikni qanoatlantiruvchi  $t_1 \in [a, +\infty)$  topiladiki,

$$\left| \int_{t_1}^x f(x,y_0)dx \right| \geq \varepsilon_0$$

bo'ladi.

### 16.3-misol. Ushbu

$$J(y) = \int_0^y ye^{-xy} dx \quad (y \in E = (0, +\infty))$$

integralni tekis yaqinlashuvchilikka tekshirilsin.

◀ Bu holda

$$F(t, y) = \int_0^t ye^{-ty} dx = 1 - e^{-ty} \quad (0 \leq t < +\infty)$$

bo'lib, y o'zgaruvchining  $E = (0, +\infty)$  to'plamdan olingan har bir tayin qiymatida

$$\lim_{t \rightarrow +\infty} F(t, y) = \lim_{t \rightarrow +\infty} (1 - e^{-ty}) = 1$$

bo'ladi. Demak, berilgan xosmas integral yaqinlashuvchi va

$$J(y) = \int_0^y ye^{-xy} dx = 1$$

bo'ladi.

Endi berilgan integralni tekis yaqinlashuvchilikka tekshiramiz. Aytaylik,  $y \in E = (0, +\infty)$

bo'lsin. Ixtiyoriy katta mushat  $\delta$  sonni olaylik. Agar  $\varepsilon = \frac{1}{3}$ ,  $t > \delta$  tengsizlikni

qanoatlantiradigan ixtiyoriy  $t_0$  va  $y_0 = \frac{1}{t_0}$  deb olsak, u holda

$$\left| \int_{t_0}^t y_0 e^{-xy_0} dx \right| = e^{-t_0 y_0} = e^{-1} > \frac{1}{3} = \varepsilon_n$$

bo'ladi. Bu esa

$$J(y) = \int_0^t y e^{-xy} dx$$

integral  $E = (0, +\infty)$  da notekis yaqinlashuvchi ekanini bildiradi.

Endi  $y \in E' = [c, +\infty) \subset E$  bo'lsin, bunda  $c$ - ixtiyoriy mushat son. Unda  $\forall \varepsilon > 0$  olinganda ham ( $0 < \varepsilon < 1$ )  $\delta = \frac{1}{c} \ln \frac{1}{\varepsilon}$  deyilsa,  $\forall t > \delta$  va  $\forall y \in [c, +\infty)$  uchun

$$\left| \int_t^\infty y e^{-xy} dx \right| = e^{-cy} = e^{-c \frac{1}{c} \ln \frac{1}{\varepsilon}} = \varepsilon$$

bo'ladi. Demak,

$$J(y) = \int_0^\infty y e^{-xy} dx$$

integral  $E' = [c, +\infty)$  da ( $c > 0$ ) tekis yaqinlashuvchi. ▶

Biz ko'rdikki parametrga bog'liq kosmas integral

$$J(y) = \int_a^\infty f(x, y) dx \quad (16.18)$$

ning  $E$  to'plamda tekis yaqinlashuvchi bo'lishi,  $t \rightarrow +\infty$  da  $F(t, y)$  funksiyani limit funksiya  $J(y)$  ga ( $y \in E$ ) tekis yaqinlashishidan iborat.

Ushbu bobning 1-§ ida  $y \rightarrow y_0$  da  $f(x, y)$  funksiya limit funksiya  $\varphi(x)$  ga tekis yaqinlashishining zaruriy va yetarli shartini ifodalovchi 1-teoremani keltirdik. Bu teoremadan foydalab, (16.18) integralning tekis yaqinlashuvchi bo'lishing zaruriy va yetarli sharti keltiriladi.

$f(x, y)$  funksiya  $M = \{(x, y) \in R^2 : x \in [a, +\infty), y \in E \subset R\}$  to'plamda berilgan, y o'zgaruvchining  $E$  to'plamdan olingan har bir tayin qiymatida  $f(x, y)$  x o'zgaruvchining funksiyasi sifatida  $[a, +\infty)$  da integrallanuvchi, ya'ni

$$J(y) = \int_a^\infty f(x, y) dx \quad (16.18)$$

kosmas integral mavjud bo'lsin.

**7-ta'rif.** Agar  $\forall \varepsilon > 0$  olinganda ham  $y$  ga bog'liq bo'limgan shunday  $\delta = \delta(\varepsilon) > 0$  topilsaki,  $t' > \delta$ ,  $t'' > \delta$  ni qanoatlantiruvchi  $\forall t', t''$  va  $\forall y \in E$  uchun

$$\left| \int_{t'}^{t''} f(x, y) dx \right| < \varepsilon$$

tengsizlik bajarilsa, (16.18) xosmas integral  $E$  to'plamda fundamental integral deb ataladi.

**10-teorema. (Koshi teoremasi).** Ushbu  $J(y) = \int f(x, y) dx$  integralning  $E$  to'plamda tekis yaqinlashuvchi bo'lishi uchun uning  $E$  to'plamda fundamental bo'lishi zarur va yetarli.

Quyida biz integralning tekis yaqinlashuvchiligini ta'minlaydigan, ko'pincha qo'llaniladigan alomatlarni keltiramiz.

**Veyershtass** *alomati.*  $f(x, y)$  funksiya  $M = \{(x, y) \in R^2 : x \in [a, +\infty), y \in E \subset R\}$  to'plamda berilgan, y o'zgaruvchining  $E$  to'plamdan olingan har bir tayin qiymatida  $f(x, y)$  funksiya  $x$  o'zgaruvchining funksiyasi sifatida  $[a, +\infty)$  da integrallanuvchi bo'lсин. Agar shunday  $\phi(x)$  funksiya ( $\forall x \in [a, +\infty)$ ) topilsaki,

1)  $\forall x \in [a, +\infty)$  va  $\forall y \in E$  uchun  $|f(x, y)| \leq \phi(x)$  bo'lsa;

2)  $\int \phi(x) dx$  xosmas integral yaqinlashuvchi bo'lsa, u holda

$$J(y) = \int f(x, y) dx$$

integral  $E$  to'plamda tekis yaqinlashuvchi bo'ladi.

◀ Shartga ko'ra  $\int \phi(x) dx$  yaqinlashuvchi. Unda 15-bobning 2-§ ida keltirilgan 4-teoremaga asosan,  $\forall \varepsilon > 0$  olinganda ham, shunday  $\delta = \delta(\varepsilon) > 0$  topiladiki.  $\forall t' > \delta$ ,  $\forall t'' > \delta$  bo'lganda  $\left| \int \phi(x) dx \right| < \varepsilon$  bo'ladi. Ikkinci tomondan,

1) shartdan foydalanib quyidagini topamiz:

$$\left| \int f(x, y) dx \right| \leq \int |f(x, y)| dx \leq \int \phi(x) dx. \quad ((t' < t''))$$

Demak,

$$\left| \int f(x, y) dx \right| < \varepsilon.$$

Bu esa  $\int f(x, y) dx$  xosmas integralning  $E$  to'plamda fundamental ekanini bildiradi. Yuqoridagi 10-teoremaga asosan  $\int f(x, y) dx$  integral  $E$  to'plamda tekis yaqinlashuvchi bo'ladi.

**16.4-misol.** Ushbu

$$\int_0^\infty \frac{\cos \frac{xy}{2}}{1+x} dx \quad (y \in E = (-\infty, +\infty))$$

integralni tekis yaqinlashuvligi ko'rsatilsin.

◀ Agar  $\varphi(x)$  funksiya sifatida  $\varphi(x) = \frac{1}{1+x^2}$  olsansa, u holda

1)  $\forall x \in [0, +\infty)$  va  $\forall y \in (-\infty, +\infty)$  uchun

$$|f(x, y)| = \left| \frac{\cos xy}{1+x^2} \right| \leq \frac{1}{1+x^2} = \varphi(x);$$

$$2) \int_0^\infty \varphi(x) dx = \int_0^\infty \frac{dx}{1+x^2} \text{ integral yaqinlashuvchi (qaralsin, 15-bob, 1-§)}$$

bo'ladi. Demak, Veyershtress alomatiga ko'ra berilgan integral  $E = (-\infty, +\infty)$  da tekis yaqinlashuvchi bo'ladi. ▶

Integralning tekis yaqinlashuvchiligidagi aniqlashda qo'l keladigan alomatlardan -Abel va Dirixle alomatlari isbotsiz keltiramiz.

*Abel alomati.*  $f(x, y)$  va  $g(x, y)$  funksiyalar  $M = \{(x, y) \in R^2 : x \in [a, +\infty), y \in E \subset R\}$  to'plamda berilgan.  $y$  o'zgaruvchining  $E$  to'plamidan olingan har bir tayin qiymatida  $g(x, y)$  funksiya  $x$  ning funksiyasi sifatida  $[a, +\infty)$  da monoton funksiya bo'lsin.

Agar

$$\int_a^\infty f(x, y) dx$$

integral  $E$  to'plamda tekis yaqinlashuvchi va  $\forall (x, y) \in M$  uchun  $|g(x, y)| < C$  ( $C = const$ ) bo'lsa, u holda

$$\int_a^\infty f(x, y) g(x, y) dx$$

integral  $E$  to'plamda tekis yaqinlashuvchi bo'ladi.

*16.5-misol.* Ushbu

$$\int_0^\infty \frac{\sin x}{x} e^{-xy} dx \quad (y \in E = [0, +\infty))$$

integralni tekis yaqinlashuvchiligi ko'rsatilsin.

◀ Agar

$$f(x, y) = \frac{\sin x}{x}, \quad g(x, y) = e^{-xy}$$

deb olinsa, Abel alomati shartlari bajariladi. Haqiqatdan ham.  $\int_0^\infty f(x, y) dx$  tekis yaqinlashuvchi:

$$\int_0^\infty f(x, y) dx = \int_0^\infty \frac{\sin x}{x} dx = \frac{\pi}{2}$$

$g(x, y) = e^{-xy}$  esa  $y$  ning  $E = [a, +\infty)$  dan olingan har bir tayin qiymatida  $x$  ning kamayuvchi funksiyasi va  $\forall x \in [0, +\infty)$ ,  $\forall y \in E = [0, +\infty)$  uchun  $|g(x, y)| < 1$  bo'ladi. Demak, berilgan integral Abel alomatiga ko'ra  $E = [0, +\infty)$  da tekis yaqinlashuvchi. ▶

*Dirixle alomatı.*  $f(x, y)$  va  $g(x, y)$  funksiyalar  $M$  to'plamda berilgan. Agar  $\forall t \geq a$  hamda  $\forall y \in E$  uchun

$$\left| \int f(x, y) dx \right| \leq c \quad (c = \text{const})$$

bo'lsa va  $y$  o'zgaruvchining  $E$  dan olingan har bir tayin qiymatida,  $x \rightarrow +\infty$  da  $g(x, y)$  funksiya o'z limit funksiyasi  $\varphi(y) = 0$  ga tekis yaqinlashsa, u holda

$$\int f(x, y) g(x, y) dx$$

integral  $E$  da tekis yaqinlashuvchi bo'ladi.

*16.6-misol.* Ushbu

$$\int_0^t \frac{\sin xy}{x} dx \quad (y \in E = [1, 2])$$

integralning tekis yaqinlashuvchiligi ko'rsatilsin.

◀ Agar

$$f(x, y) = \sin xy, \quad g(x, y) = \frac{1}{x}$$

deyilsa, uncha  $\forall t > 0$ ,  $\forall y \in [1, 2]$  uchun

$$\left| \int f(x, y) dx \right| = \left| \int_0^t \sin xy dx \right| = \left| t - \frac{\cos ty}{y} \right| < 2$$

bo'ladi.  $x \rightarrow +\infty$  da  $g(x, y) = \frac{1}{x}$  funksiya  $E$  to'plamda nolga tekis yaqinlashadi:

$$g(x, y) = \frac{1}{x} \rightarrow 0.$$

Demak, berilgan integral Dirixle alomatiga ko'ra  $[1, 2]$  da tekis yaqinlashuvchidir. ►

Chegaralanmagan funksiya xosmas integralning tekis (notekis) yaqinlashuvchiligi tushunchasi ham yuqoridagidek kiritiladi.

$f(x, y)$  funksiya  $M = \{(x, y) \in R^2 : x \in [a, a], y \in E \subset R\}$  to'plamda berilgan.  $y$  o'zgaruvchining  $E$  dan olingan har bir tayin qiymatida  $f(x, y)$  ni  $x$  o'zgaruvchining funksiyasi sifatida qaraqanda uning uchun  $x = \varepsilon$  maxsus nuqta bo'lsin va bu funksiya  $[a, a]$  da integrallanuvchi bo'lsin. Chegaralanmagan funksiya xosmas integrali ta'rifiga ko'ra ixtiyoriy  $[a, t]$  da ( $a < t < \varepsilon$ )

$$F_1(t, y) = \int f(x, y) dx$$

integral mavjud va

$$J_1(y) = \int f(x, y) dx = \lim_{t \rightarrow a^+} F_1(t, y) \quad (16.22)$$

bo'ladi. Demak,  $J_1(y)$  funksiya  $F_1(t, y)$  funksiyaning  $t \rightarrow a^+$  daagi limiti funksiyasi.

**8-ta'rif.** Agar  $t \rightarrow a - 0$  da  $F_1(t, y)$  funksiya o'z limit funksiyasi  $J_1(y)$  ga  $E$  to'plamda tekis yaqinlashsha,

$$\int f(x, y) dx$$

integral  $E$  to'plamda tekis yaqinlashuvchi deb ataladi.

**9-ta'rif.** Agar  $t \rightarrow a + 0$  da  $F_1(t, y)$  funksiya o'z limit funksiyasi  $J_1(y)$  ga  $E$  to'plamda notekis yaqinlashsha,

$$\int f(x, y) dx$$

integral  $E$  to'plamda notekis yaqinlashuvchi deb ataladi.

Bu ta'riflarni " $\varepsilon - \delta$ " orqali bayon etishni o'quvchiga havola etamiz.

**10-ta'rif.** Agar  $\forall \varepsilon > 0$  olinganda ham, shunday  $\delta = \delta(\varepsilon) > 0$  topilsaki,  $a - \delta < t' < a$ ,  $a - \delta < t'' < a$  bo'lgan  $\forall t', t''$  lar va  $\forall y \in E$  uchun

$$\left| \int f(x, y) dx \right| < \varepsilon$$

tengsizlik bajarilsa, (16.22) integral  $E$  to'plamda fundamental integral deb ataladi.

**11-teorema.**  $\int f(x, y) dx$  integralning  $E$  to'plamda tekis yaqinlashuvchi bo'lishi uchun uning  $E$  to'plamda fundamental bo'lishi zarur va yetarli.

#### 4-§. Tekis yaqinlashuvchi parametrga hog'liq xosmas integrallarning xossalari

**1º. Integral belgisi ostida limit o'tish.**  $f(x, y)$  funksiya  $M = \{(x, y) \in R^2 : x \in [a, +\infty), y \in E \subset R\}$  to'plamda berilgan.  $y_0$  nuqta  $E$  to'plamning limit nuqtasi bo'lsin.

**12-teorema.**  $f(x, y)$  funksiya

1)  $y$  o'zgaruvchining  $E$  dan olinigan har bir tayin qiymatida  $x$  o'zgaruvchining funksiyasi sifatida  $[a, +\infty)$  da uzliksiz;

2)  $y \rightarrow y_0$  da ixtiyoriy  $[a, t]$  ( $a < t < +\infty$ ) oraliqda  $\varphi(x)$  limit funksiyaga tekis yaqinlashuvchi bo'lsin. Agarda

$$J(y) = \int f(x, y) dx$$

integral  $E$  to'plamda tekis yaqinlashuvchi bo'lsin, u holda  $y \rightarrow y_0$  da  $J(y)$  funksiya limitiga ega va

$$\lim_{y \rightarrow y_0} J(y) = \lim_{t \rightarrow +\infty} \int_a^t f(x, y) dx = \int_a^{\infty} \varphi(x) dx$$

bo'ladi.

◀ Teoremaning 1) va 2) shartlari hamda ushbu bobning 1-§ idagi 2-teoremadan  $\varphi(x)$  limit funksiyaning  $[a, +\infty)$  da uzliksiz bo'lishi kelib chiqadi. Demak,  $\varphi(x)$  funksiya har bir chekli  $[a, t]$  ( $a < t < +\infty$ ) oraliqda integrallanuvchi.

$\varphi(x)$  ni  $[a, +\infty)$  da integrallanuvchi ekanligini ko'rsataylik.

Teoremaning shartiga ko'ra

$$J(y) = \int_a^{\infty} f(x, y) dx$$

integral  $E$  da tekis yaqinlashuvchi. Unda 10-teoremaga asosan,  $\forall \varepsilon > 0$  olinganda ham, shunday  $\delta = \delta(\varepsilon) > 0$  topiladiki,  $t' > \delta$ ,  $t'' > \delta$  bo'lgan  $\forall t, t'$  lar va  $\forall y \in E$  uchun

$$\left| \int_a^t f(x, y) dx \right| < \varepsilon \quad (16.23)$$

bo'ladi.  $f(x, y)$  funksiyaga qo'yilgan shartlar 2-§ da keltirilgan 3-teorema shartlarining bajarilishini ta'minlaydi. (16.23) tenglikda  $y \rightarrow y_0$  da limitga o'tib quyidagini topamiz:

$$\left| \int_a^t \varphi(x) dx \right| \leq \varepsilon.$$

Bundan esa  $\varphi(x)$  ning  $[a, +\infty)$  da integrallanuvchi bo'lishi kelib chiqadi (15-boh, 2-§).

Endi

$$\left| \int_a^t f(x, y) dx - \int_a^t \varphi(x) dx \right|$$

ayirmani quyidagicha yozib,

$$\begin{aligned} \left| \int_a^t f(x, y) dx - \int_a^t \varphi(x) dx \right| &= \left| \int_a^t [f(x, y) - \varphi(x)] dx \right| = \left| \int_a^t f(x, y) dx - \int_a^t \varphi(x) dx \right| - \\ &- \left| \int_a^t \varphi(x) dx \right| \leq \int_a^t |f(x, y) - \varphi(x)| dx + \left| \int_a^t f(x, y) dx \right| + \\ &+ \left| \int_a^t \varphi(x) dx \right| \quad (a < t < +\infty) \end{aligned} \quad (16.24)$$

tengsizlikning o'ne tenelegantagi har bir qo'shiluvchini baholaymiz.

$\int_a^t f(x, y) dx$  integral  $E$  da tekis yaqinlashuvchi. Demak,  $\exists \delta_1 > 0$  olinganda ham shunday  $\delta_1 = \delta_1(\varepsilon) > 0$  topiladiki, barcha  $t > \delta_1$  va  $\forall y \in E$  uchun

$$\left| \int_a^t f(x, y) dx \right| < \frac{\varepsilon}{3} \quad (16.25)$$

bo'ladi.

$\int_a^t \varphi(x) dx$  xosmas integral yaqinlashuvchi. Demak, yuqoridagi  $\forall \varepsilon > 0$  olinganda ham shunday  $\delta_2 = \delta_2(\varepsilon) > 0$  topiladiki, barcha  $t > \delta_2$  uchun

$$\left| \int_a^t \varphi(x) dx \right| < \frac{\varepsilon}{3} \quad (16.26)$$

bo'ladi.

Agar  $\delta_0 = \max\{\delta_1, \delta_2\}$  deb olinsa, barcha  $t > \delta_0$  uchun (16.25) va (16.26) tengsizliklar bir yo'la bajariladi.  $y \rightarrow y_0$  da  $f(x, y)$  funksiya  $\varphi(x)$  limit funksiyaga har bir  $[a, t]$  (jumladan  $t > \delta_0$ ) da tekis yaqinlashuvchi. Demak,  $\forall \varepsilon > 0$  olinganda ham, shunday  $\delta' > 0$  topiladiki,  $|y_n - y_0| < \delta'$  tengsizlikni qanoatlaniruvchi  $y \in E$  va  $\forall x \in [a, a]$  uchun

$$|f(x, y) - \varphi(x)| < \frac{\varepsilon}{3(t-a)} \quad (16.27)$$

bo'ladi. Natijada (16.24), (16.25), (16.26) va (16.27) tengsizliklarga ko'ra

$$\left| \int_a^t f(x, y) dx - \int_a^t \varphi(x) dx \right| < \varepsilon$$

bo'ladi. Bu esa

$$\lim_{t \rightarrow +\infty} \int_a^t f(x, y) dx = \int_a^{+\infty} \varphi(x) dx \quad (16.28)$$

bo'lishini bildiradi. ▶

(16.28)limit munosabatni quyidagicha ham yozish mumkin:

$$\lim_{y \rightarrow y_0} \int_a^t f(x, y) dx = \int_a^t \left( \lim_{y \rightarrow y_0} f(x, y) \right) dx.$$

Bu esa 12-teoremaning shartlari bajarilganda parametrga hog'liq xosmas integrallarda ham integral belgisi ostida limitga o'tish mumkinligini ko'rsatadi.

**2<sup>q</sup>. Integrallarning parametr bo'yicha uzluksizligi.**  $f(x, y)$  funksiya  $M = \{(x, y) \in R^2 : x \in [a, +\infty), y \in [c, d]\}$  to'plamda berilgan.

**14-teorema.**  $f(x, y)$  funksiya  $M$  to'plamda uzluksiz va

$$J(y) = \int_a^{+\infty} f(x, y) dx$$

integral  $[c, d]$  da tekis yaqinlashuvchi bo'sin. U holda  $J(y)$  funksiya  $[c, d]$  oraliqda uzluksiz bo'ladi.

◀  $f(x, y)$  funksiyaning  $M$  to'plamda uzluksizligidan, avvalo bu funksiya  $y$  o'zgaruvchining har bir tayin qiymatida  $x$  ning uzluksiz funksiyasi bo'lishi kelib chiqadi. Shu bilan birga  $f(x, y)$  funksiya  $M_y = \{(x, y) \in R^2 : x \in [a, t], y \in [c, d]\}$  ( $a < t < +\infty$ ) to'plamda ham uzluksiz, demak, shu to'plamda tekis uzluksiz bo'ladi.

$\forall y_0 \in [c, d]$  nuqtani olaylik.  $y \rightarrow y_0$  da  $f(x, y)$  funksiya  $f(x, y_0)$  limit funksiyaga  $[a, t]$  da tekis yaqinlashadi. Agar teoremaning ikkinchi shartini e'tiborga olsak, u holda  $f(x, y)$  funksiya 12-teoremaning barcha shartlarini bajarishini ko'ramiz. U holda 12-teoremaga asosan

$$\lim_{y \rightarrow y_0} J(y) = \lim_{y \rightarrow y_0} \int_a^{+\infty} f(x, y) dx = \int_a^{+\infty} \left( \lim_{y \rightarrow y_0} f(x, y) \right) dx = \int_a^{+\infty} f(x, y_0) dx = J(y_0)$$

bo'ladi. Bu esa  $J(y)$  funksiyaning  $[c, d]$  oraliqda uzluksiz ekanini bildiradi. ▶

**3<sup>a</sup>. Integralarni parametr bo'yicha differensiallash.**  $f(x, y)$  funksiya  $M = \{(x, y) \in R^2 : x \in [a, +\infty), y \in [c, d]\}$  to'plamda berilgan.

**16-teorema.**  $f(x, y)$  funksiya  $M$  to'plamda uzlusiz.  $f'_y(x, y)$  xususiy hosilaga ega va u ham uzlusiz hamda  $y$  o'zgaruvchining  $[c, d]$  dan olingan har bir tayin qiymatida

$$J(y) = \int_a^{+\infty} f(x, y) dx$$

integral yaqinlashuvchi bo'lsin.

Agar  $\int f'_y(x, y) dx$  integral  $[c, d]$  da tekis yaqinlashuvchi bo'lsa, u holda  $J(y)$  funksiya ham  $[c, d]$  oraliqda  $J'(y)$  hosilaga ega bo'ladi va

$$J'(y) = \int_c^d f'_y(x, y) dx$$

munosabat o'rinnidir.

◀  $\forall y_0 \in [c, d]$  nuqtani olib, unga shunday  $\Delta y$  ( $\Delta y \geq 0$ ) ortirma beraylikki,  $y_0 + \Delta y \in [c, d]$  bo'lzin.

$J(y)$  funksiyaning  $y_0$  nuqtadagi ortirmasini olib, ushbu

$$\frac{J(y_0 + \Delta y) - J(y_0)}{\Delta y} = \int_{y_0}^{y_0 + \Delta y} f(x, y) dx \quad (16.29)$$

tenglikni hosil qilamiz. Endi (16.29) tenglikdagi integralda  $\Delta y \rightarrow 0$  da integral belgisi ostida limitga o'tish mumkinligini ko'rsatamiz.

Lagranj teoremasiga ko'ra

$$\frac{f(x, y_0 + \Delta y) - f(x, y_0)}{\Delta y} = f'_y(x, y_0 + \theta \Delta y) \quad (16.30)$$

bo'ladi, bunda  $0 < \theta < 1$ .

Shunga ko'ra  $f'_y(x, y)$  funksiya  $M_y = \{(x, y) \in R^2 : x \in [a, t], y \in [c, d]\}$  to'plamda uzlusiz, demak, tekis uzlusiz. U holda  $\forall \varepsilon > 0$  olinganda ham, shunday  $\delta = \delta(\varepsilon) > 0$  topiladiki,  $|x'' - x'| < \delta, |y'' - y'| < \delta$  tengsizliklarni qanoatlantiruvchi ixtiyoriy  $(x'', y'') \in M_y, (x', y') \in M_y$ , nuqtalar uchun

$$|f'_y(x'', y'') - f'_y(x', y')| < \varepsilon$$

bo'ladi. Agar  $x' = x'' = x, y' = y_0, y'' = y_0 + \theta \Delta y$  deyilsa, unda  $|\Delta y| < \delta$  bo'lganda

$$|f'_y(x, y_0 + \theta \Delta y) - f'_y(x, y_0)| < \varepsilon \quad (\forall x \in [a, t])$$

bo'ladi. Yuqoridagi (16.30) tenglikdan foydalanim quydagini topamiz:

$$\left| \frac{f(x, y_0 + \Delta y) - f(x, y_0)}{\Delta y} - f'_y(x, y_0) \right| < \varepsilon.$$

Bu esa  $\Delta y \rightarrow 0$  da  $\frac{f(x, y_0 + \Delta y) - f(x, y_0)}{\Delta y}$  funksiya  $f'_y(x, y_0)$  limit funksiyaga tekis yaqinlashishini bildiradi.

## Teoremaning shartiga ko'ra

$$\int f'_y(x, y) dx$$

tekis yaqinlashuvchi. Demak,  $\forall \varepsilon > 0$  olinganda ham, shunday  $\delta = \delta(\varepsilon) > 0$  topiladiki,  $t' > \delta$ ,  $t'' > \delta$  bo'lgan ixtiyoriy  $t', t''$  va  $\forall y \in [c, d]$  uchun

$$\left| \int_t^t f'_y(x, y) dx \right| < \varepsilon$$

bo'ladi. Jumladan

$$\left| \int_a^b f(x, y_0 + \theta \Delta y) dx \right| < \varepsilon$$

bo'ladi. (16.30) tenglikka asosan

$$\left| \int_a^b \frac{f(x, y_0 + \Delta y) - f(x, y_0)}{\Delta y} dx \right| < \varepsilon$$

bo'ladi. Bu esa

$$\int_a^b \frac{f(x, y_0 + \Delta y) - f(x, y_0)}{\Delta y} dx$$

integralning tekis yaqinlashuvchiliginini bildiradi.

Natijada 12-teoremaiga ko'ra

$$\lim_{\Delta y \rightarrow 0} \int_a^b \frac{f(x, y_0 + \Delta y) - f(x, y_0)}{\Delta y} dx = \int_a^b \left( \lim_{\Delta y \rightarrow 0} \frac{f(x, y_0 + \Delta y) - f(x, y_0)}{\Delta y} \right) dx$$

tenglik o'rini bo'ladi.

Yuqorida (16.29) tenglikda  $\Delta y \rightarrow 0$  da limitga o'tamiz:

$$\begin{aligned} \lim_{\Delta y \rightarrow 0} \frac{f(x, y_0 + \Delta y) - f(x, y_0)}{\Delta y} &= \lim_{\Delta y \rightarrow 0} \int_a^b \frac{f(x, y_0 + \Delta y) - f(x, y_0)}{\Delta y} dx = \\ &= \int_a^b \left( \lim_{\Delta y \rightarrow 0} \frac{f(x, y_0 + \Delta y) - f(x, y_0)}{\Delta y} \right) dx = \int_a^b f'_y(x, y_0) dx. \end{aligned}$$

Demak,

$$J'(y_0) = \int_a^b f'_y(x, y_0) dx \quad \blacktriangleright$$

Keyingi munosabatdan quyidagicha ham yozish mumkin:

$$\frac{d}{dy} \int_a^b f(x, y) dy = \int_a^b \left( \frac{d}{dy} f(x, y) \right) dy.$$

Bu esa teorema shartlarida differensiallash amalini integral belgisi ostida o'tkazish mumkinligini ko'rsatadi.

**4° Integrallarni parametr bo'yicha integrallash.**  $f(x, y)$  funksiya  $M = \{(x, y) \in R^2 : x \in [a, +\infty), y \in [c, d]\}$  to'plamda berilgan.

**18-teorema.** Agar  $f(x, y)$  funksiya  $M$  to'plamda uzlusiz va

$$J(y) = \int_a^b f(x, y) dx$$

integral  $[c, d]$  oraliqda tekis yaqinlashuvchi bo'lsa, u holda  $J(y)$  funksiya  $[c, d]$  da integrallanuvchi va

$$\int_c^d J(y) dy = \int_c^{\infty} \left( \int_a^{+\infty} f(x, y) dx \right) dy - \int_a^{+\infty} \left( \int_c^d f(x, y) dy \right) dx$$

bo'ladi.

◀ Teoremaning shartlaridan  $J(y)$  funksiya  $[c, d]$  oraliqda uzliksiz bo'lishi kelib chiqadi (qaralsin, 4-teorema). Demak,  $J(y)$  funksiya  $[c, d]$  da integrallanuvchi.

Endi

$$\int_c^d \left( \int_a^{+\infty} f(x, y) dx \right) dy = \int_a^{+\infty} \left( \int_c^d f(x, y) dy \right) dx$$

tenglikning o'rini bo'lishini ko'rsatamiz.

Shartga ko'ra

$$J(y) = \int_a^{+\infty} f(x, y) dx$$

integral  $[c, d]$  da tekis yaqinlashuvchi. Demak,  $\forall \varepsilon > 0$  olinganda ham shunday  $\delta = \delta(\varepsilon) > 0$  topiladiki,  $\forall t > \delta$  va  $\forall y \in [c, d]$  uchun

$$\left| \int_t^{+\infty} f(x, y) dx \right| < \varepsilon \quad (16.31)$$

bo'ladi. Mana shunday  $t$  bo'yicha

$$\left| \int_c^t \int_a^{+\infty} f(x, y) dx dy \right|$$

integralni quyidagicha yozamiz:

$$\left| \int_c^d \left( \int_a^{+\infty} f(x, y) dx \right) dy \right| = \left| \int_c^d \left( \int_a^t f(x, y) dx \right) dy + \int_c^d \left( \int_t^{+\infty} f(x, y) dx \right) dy \right|$$

6-teoremaga asosan

$$\left| \int_c^d \left( \int_a^{+\infty} f(x, y) dx \right) dy \right| = \left| \int_c^d \left( \int_a^t f(x, y) dx \right) dy \right|$$

bo'ladi. Natijada

$$\left| \int_c^d J(y) dy \right| = \left| \int_c^d \left( \int_a^t f(x, y) dx \right) dy \right| + \left| \int_c^d \left( \int_t^{+\infty} f(x, y) dx \right) dy \right|$$

bo'ladi. Yuqoridagi (16.31) munosabatni e'tiborga olib topamiz:

$$\left| \int_c^d J(y) dy - \int_c^d \left( \int_a^t f(x, y) dx \right) dy \right| \leq \int_c^d \left| \int_t^{+\infty} f(x, y) dx \right| dy < \varepsilon(d - c).$$

Bu esa

$$\int_c^d J(y) dy = \lim_{t \rightarrow +\infty} \int_c^d \left( \int_a^t f(x, y) dx \right) dy = \int_a^{+\infty} \left( \int_c^d f(x, y) dy \right) dx$$

ekanini bildiradi. Demak,

$$\left| \int_a^{+\infty} \left| \int_c^{+\infty} f(x, y) dx \right| dy \right| = \int_a^{+\infty} \left| \int_c^{+\infty} f(x, y) dy \right| dx. \blacktriangleright$$

Endi  $f(x, y)$  funksiya  $M_2 = \{(x, y) \in R^2 : x \in [a, +\infty), y \in [c, +\infty)\}$  to'plamda berilgan bo'lsin.

**19-teorema.**  $f(x, y)$  funksiya  $M_2$  to'plamda uzlusiz va

$$\int_a^{+\infty} f(x, y) dx, \quad \int_c^{+\infty} f(x, y) dy$$

integrallar mos ravishda  $[c, +\infty)$  va  $[a, +\infty)$  da tekis yaqinlashuvchi bo'lsin.

Agar

$$\int_c^{+\infty} \left( \int_a^{+\infty} f(x, y) dx \right) dy \quad (\text{yoki} \quad \int_a^{+\infty} \left( \int_c^{+\infty} f(x, y) dy \right) dx)$$

integral yaqinlashuvchi bo'lsa, u holda

$$\int_a^{+\infty} \left( \int_c^{+\infty} f(x, y) dy \right) dx, \quad \int_c^{+\infty} \left( \int_a^{+\infty} f(x, y) dx \right) dy$$

integrallar yaqinlashuvchi va

$$\int_a^{+\infty} \left( \int_c^{+\infty} f(x, y) dx \right) dy = \int_c^{+\infty} \left( \int_a^{+\infty} f(x, y) dy \right) dx$$

bo'ladi.

Bu teoremaning isbotini o'quvchiga havola qilamiz.

**16.7-misol.** Ushbu

$$J = \int_0^{+\infty} \frac{\sin x}{x} dx$$

integral hisoblansin.

◀ Bu xosmas integralning yaqinlashuchi bo'lishi 15-bo'bbning 2-§ ida ko'rsatilgan edi. Endi berilgan integralni hisoblaymiz. Buning uchun quyidagi

$$J(a) = J = \int_0^{+\infty} e^{-ax} \frac{\sin x}{x} dx$$

parametrga bog'liq xosmas integralni qaraymiz.

Ravshanki,

$$f(x, a) = e^{-ax} \frac{\sin x}{x} \quad (f(0, a) = 1)$$

funksiya

$$\{(x, a) \in R^2 : x \in [0, +\infty), a \in [0, c], c > 0\}$$

to'plamda uzlusiz,

$$f'_a(x, a) = -e^{-ax} \sin x$$

xususiy hosilaga ega va u ham uzlusiz funksiya. Quyidagi

$$\int_a^{+\infty} f'_a(x, a) dx = - \int_a^{+\infty} e^{-ax} \sin x dx$$

integral esa  $a \geq a_0$ . ( $a_0 > 0$ ) da tekis yaqinlashuvchi. 16-teoremaga ko'ra

$$J(a) = \int_0^{\pi} \left( e^{-ax} \frac{\sin x}{x} \right) dx = - \int_0^{\pi} e^{-ax} \sin x dx = -\frac{1}{1+a^2}$$

bo'ladi (qaralsin, 1-qism, 8-bo'b, 2-\$\\$). Demak.

$$J(a) = -\operatorname{arctg} a + c.$$

$a = +\infty$  bo'lganda,  $J(+\infty) = 0$  bo'lib,  $-\frac{\pi}{2} + c = 0$  ya'ni  $c = \frac{\pi}{2}$  bo'ladi.

Demak,

$$J(a) = \frac{\pi}{2} - \operatorname{arctg} a.$$

Bu tenglikda  $a \rightarrow 0$  da limitga o'tib quyidagini topamiz:

$$\lim_{a \rightarrow 0} J(a) = \frac{\pi}{2}.$$

Shunday qilib,  $J(0) = \frac{\pi}{2}$  ya'ni  $J = \int \frac{\sin x}{x} dx = \frac{\pi}{2}$

$$J = \int_0^{\pi} \frac{\sin x}{x} dx = \frac{\pi}{2}$$

bo'ladi. ▶

### S-\$\\$\$. Eyler integralлари

I". Beta funksiya va uning xossalari. Ma'lumki, ushbu

$$\int_0^1 x^{a-1} (1-x)^{s-1} dx \quad (16.32)$$

cheгараланмаган funksiyaning xosmas integrali  $a > 0$ ,  $s > 0$  ya'ni

$$M = \{(a, s) \in R^2 : a \in (0, +\infty), s \in (0, +\infty)\}$$

to'plamda yaqinlashuvchi (15-bo'b). Ayni paytda bu integral  $a$  va  $s$  parametrlarga ham bog'liq.

II-ta'rif. (16.32) integral beta funksiya yoki I tur Eyler integrali deb ataladi va  $B(a, s)$  kabi belgilanadi. demak,

$$B(a, s) = \int_0^1 x^{a-1} (1-x)^{s-1} dx.$$

Shunday qilib,  $B(a, s)$  funksiya  $R^2$  fazodagi  $M = \{(a, s) \in R^2 : a \in (0, +\infty), s \in (0, +\infty)\}$  to'plamda berilgandir.

Endi  $B(a, s)$  funksiyaning xossalari o'rganaylik.

1) (16.32) integral

$$B(a, s) = \int_0^1 x^{a-1} (1-x)^{s-1} dx$$

ixtiyoriy  $M = \{(a, s) \in R^2 : a \in (a_0, +\infty), s \in (s_0, +\infty)\}$  ( $a_0 > 0$ ,  $s_0 > 0$ ) to'plamda tekis yaqinlashuvchi bo'ladi.

◀ Berilgan integralni tekis yaqinlashuvchilikka tekshirish uchun uni quyidagicha

$$\int_0^1 x^{a-1} (1-x)^{s-1} dx = \int_0^{\frac{1}{2}} x^{a-1} (1-x)^{s-1} dx + \int_{\frac{1}{2}}^1 x^{a-1} (1-x)^{s-1} dx$$

yozib olamiz.

Ravshanki,  $a > 0$  bo'lganda  $\int_0^{\frac{1}{2}} x^{a-1} dx$  integral yaqinlashuvchi,  $s > 0$

bo'lganda  $\int_{\frac{1}{2}}^1 x^{a-1} dx$  integral yaqinlashuvchi.

Parametr  $a$  ning  $a \geq a_0$  ( $a_0 > 0$ ) qiymatlari va  $\forall s > 0$ ,  $\forall x \in \left(0, \frac{1}{2}\right]$  uchun

$$x^{a-1} (1-x)^{s-1} \leq x^{a_0-1} (1-x)^{s-1} \leq 2x^{a_0-1}$$

bo'ladi. Veyershtrass alomatidan foydalanih,

$$\int_0^{\frac{1}{2}} x^{a-1} (1-x)^{s-1} dx$$

integralning tekis yaqinlashuvchiligidini topamiz.

Shuningdek, parametr  $s$  ning  $s \geq s_0$  ( $s_0 > 0$ ) qiymatlari va  $\forall a > 0$ ,  $\forall x \in \left[\frac{1}{2}, 1\right)$  uchun

$$x^{a-1} (1-x)^{s-1} \leq x^{a-1} (x-1)^{s_0-1} \leq 2(1-x)^{s_0-1}$$

bo'ladi va yana Veyershtrass alomatiga ko'ra  $\int_{\frac{1}{2}}^1 x^{a-1} (1-x)^{s-1} dx$  integralning tekis yaqinlashuvchiligi kelib chiqadi.

Demak,  $\int_0^1 x^{a-1} (1-x)^{s-1} dx$  integral  $a \geq a_0 > 0$  va  $s \geq s_0 > 0$  bo'lganda, ya'ni

$$M_0 = \{(a, s) \in R^2 : a \in [a_0, +\infty), s \in [s_0, +\infty)\}$$

to'plamda tekis yaqinlashuvchi bo'ladi. ▶

2)  $B(a, s)$  funksiya  $M = \{(a, s) \in R^2 : a \in (a_0, +\infty), s \in (s_0, +\infty)\}$  to'plamda uzliksiz funksiyadir.

◀ Haqiqatdan ham.

$$B(a, s) = \int_0^1 x^{a-1} (1-x)^{s-1} dx$$

integralning  $M_0$  to'plamda tekis yaqinlashuvchi bo'lishidan va integral ostidagi funksiyaning  $\forall (a, s) \in M$  da uzliksizligidan 15-teoremaga asosan  $B(a, s)$  funksiya

$$M = \{(a, \alpha) \in R^2 : a \in (0, +\infty), \alpha \in (0, +\infty)\}$$

to'plamda uzluksiz bo'ladi. ►

3)  $\forall (a, \alpha) \in M$  uchun  $B(a, \alpha) = B(\alpha, a)$  bo'ladi.

◀ Darhaqiqat  $B(a, \alpha) = \int_0^a x^{\alpha-1} (1-x)^{a-1} dx$  integralda  $x = 1-t$  almashtirish

bajarilsa, unda

$$B(a, \alpha) = \int_0^a x^{\alpha-1} (1-x)^{a-1} dx = \int_0^1 t^{\alpha-1} (1-t)^{a-1} dt = B(\alpha, a)$$

bo'lishini topamiz. ►

4)  $B(a, \alpha)$  funksiya quyidagicha ham ifodalanadi:

$$B(a, \alpha) = \int_0^\infty \frac{t^{\alpha-1}}{(1+t)^{a+\alpha}} dt .$$

◀ Haqiqatdan ham, (16.32) integralda  $x = \frac{t}{1+t}$  almashtirish bajarilsa, u holda

$$B(a, \alpha) = \int_0^\infty x^{\alpha-1} (1-x)^{a-1} dx = \int_0^\infty \left( \frac{t}{1+t} \right)^{\alpha-1} \left( 1 - \frac{t}{1+t} \right)^{a-1} \frac{dt}{(1+t)^2} = \int_0^\infty \frac{t^{\alpha-1}}{(1+t)^{a+\alpha}} dt$$

bo'ladi. ►

Xususan,  $a = 1 - \alpha$  ( $0 < \alpha < 1$ ) bo'lganda

$$B(a, 1-a) = \int_0^\infty \frac{t^{\alpha-1} dt}{1+t} = \frac{\pi}{\sin \alpha \pi}$$

bo'ladi (qaralsin, 17-bo'b). Keyingi munosabatdan quyidagini topamiz:

$$B\left(\frac{1}{2}, \frac{1}{2}\right) = \pi .$$

5)  $\forall (a, \alpha) \in M'$  ( $M' = \{(a, \alpha) \in R^2 : a \in (0, +\infty), \alpha \in (1, +\infty)\}$ ) uchun

$$B(a, \alpha) = \frac{\alpha-1}{a+\alpha-1} B(a, \alpha-1)$$

bo'ladi.

◀ (16.32) integralni bo'laklab integrallaymiz:

$$B(a, \alpha) = \int_0^1 x^{\alpha-1} (1-x)^{a-1} dx = \int_0^1 (1-x)^{a-1} d\left(\frac{x^\alpha}{a}\right) = \frac{1}{a} x^\alpha (1-x)^{a-1} \Big|_0^1 +$$

$$+ \frac{\alpha-1}{a} \int_0^1 x^\alpha (1-x)^{a-2} dx = \frac{\alpha-1}{a} \int_0^1 x^\alpha (1-x)^{a-2} dx \quad (a > 0, \alpha > 1)$$

Agar  $x^\alpha (1-x)^{a-2} = x^{\alpha-1} [1-(1-x)](1-x)^{a-2} = x^{\alpha-1} (1-x)^{a-2} - x^{\alpha-1} (1-x)^{a-1}$  ekanligini e'tiborga olsak, u holda

$$\int_0^1 x^\alpha (1-x)^{a-2} dx = \int_0^1 x^{\alpha-1} (1-x)^{a-2} dx - \int_0^1 x^{\alpha-1} (1-x)^{a-1} dx = B(a, \alpha-1) - B(a, \alpha)$$

bo'lib, natijada

$$B(a, \alpha) = \frac{\alpha-1}{a} (B(a, \alpha-1) - B(a, \alpha))$$

bo'ladi. Bu tenglikdan esa

$$B(a, \alpha) = \frac{\alpha - 1}{\alpha + \alpha - 1} B(\alpha, \alpha - 1) \quad (\alpha > 0, \alpha > 1)$$

bo'lishini topamiz.

Xuddi shunga o'xhash  $\forall (a, \alpha) \in M''$  uchun

$$(M'' = \{(a, \alpha) \in R^2 : a \in (1, +\infty), \alpha \in (0, +\infty)\})$$

$$B(a, \alpha) = \frac{\alpha - 1}{\alpha + \alpha - 1} B(\alpha - 1, \alpha)$$

bo'ladi. ►

Xususan,  $\alpha = n$  ( $n \in N$ ) bo'lganda

$$B(a, n) = \frac{n - 1}{a + n - 1} B(a, n - 1)$$

bo'lib, keyingi formulani takror qo'llab quyidagini topamiz.

$$B(a, n) = \frac{n - 1}{a + n - 1} \frac{n - 2}{a + n - 2} \dots \frac{1}{n + 1} B(a, 1).$$

Ravshanki,  $B(a, 1) = \int_0^1 x^{a-1} dx = \frac{1}{a}$ . Demak,

$$B(a, n) = \frac{1 \cdot 2 \dots (n - 1)}{a(a + 1)(a + 2) \dots (a + n - 1)}. \quad (16.33)$$

Agar (16.33) da  $a = m$  ( $m \in N$ ) bo'lsa, u holda

$$B(m, n) = \frac{1 \cdot 2 \dots (n - 1)}{m(m + 1) \dots (m + n - 1)} = \frac{(n - 1)! (m - 1)!}{(m + n - 1)!}$$

bo'ladi.

**2<sup>o</sup>. Gamma funksiyasi va uning xossalari.** Biz IS-bobning 9-§ ida quyidagi

$$\int_0^\infty x^{a-1} e^{-x} dx \quad (16.34)$$

xosmas integralni qaradik. Bu chegaralanmagan funksiyaning ( $a < 1$  da  $x = 0$  maxsus nuqta) cheksiz oraliq bo'yicha olingan xosmas integrali bo'lishi bilan birga  $a$  ga (parametrga) ham bog'liqidir. Usha erda (16.34) xosmas integralning  $a > 0$  da yaqinlashuvchi ekanligi ko'rsatildi.

**12-ta'rif.** (16.34) integral gamma funksiya yoki II tur Eyler integrali deb ataladi va  $\Gamma(a)$  kabi belgilanadi. Demak,

$$\Gamma(a) = \int_0^\infty x^{a-1} e^{-x} dx.$$

Shunday qilib,  $\Gamma(a)$  funksiya  $(0, +\infty)$  da berilgandir. Endi  $\Gamma(a)$  funksiyaning xossalarni o'rgandik.

1) (16.34) integral

$$\Gamma(a) = \int_0^\infty x^{a-1} e^{-x} dx$$

ixtiyoriy  $[a_0, \alpha_0]$  ( $a < a_0 < \alpha_0 < \infty$ ) oraliqda tekis yaqinlashuvchi bo'ladi.

◀ (16.34) integralni quyidagi ikki qismga ajratib,

$$\int_0^{\infty} x^{a-1} e^{-x} dx = \int_0^1 x^{a-1} e^{-x} dx + \int_1^{\infty} x^{a-1} e^{-x} dx$$

ularning har birini alohida-alohida tekis yaqinlashuvchilikka tekshiramiz.

Agar  $a_0$  ( $a_0 > 0$ ) sonni olib, parametr  $a$  ning  $a \leq a_0$  qiymatlari qaralsa, unda barcha  $x \in (0, 1]$  uchun  $x^{a-1} e^{-x} \leq \frac{1}{x^{1-a}}$  bo'lib, ushbu bobning 4-§ ida keltirilgan Veyershtrass alomatiga asosan

$$\int_0^1 x^{a-1} e^{-x} dx$$

integral tekis yaqinlashuvchi bo'ladi.

Agar  $a_0$  ( $a_0 > 0$ ) sonni olib, parametr  $a$  ning  $a \geq a_0$  qiymatlari qaraladigan bo'lsa, unda barcha  $x \geq 1$  uchun

$$x^{a-1} e^{-x} \leq x^{a_0-1} e^{-x} \leq \left(\frac{a_0+1}{e}\right)^{a_0+1} \frac{1}{x^2}$$

bo'lib,

$$\int_1^{\infty} \frac{1}{x^2} dx$$

integralning yaqinlashuvchiligidan, yana Veyershtrass alomatiga ko'ra

$$\int_1^{\infty} x^{a-1} e^{-x} dx$$

integralning tekis yaqinlashuvchi bo'lishini topamiz. Shunday qilib,

$$\Gamma(a) = \int_0^{\infty} x^{a-1} e^{-x} dx$$

integral  $[a_0, a_0]$  ( $0 < a_0 < a_0 < +\infty$ ) da tekis yaqinlashuvchi bo'ladi. ►

2)  $\Gamma(a)$  funksiya  $(0, +\infty)$  da uzuksiz hamda barcha tartibdagi uzuksiz hosilalarga ega va

$$\Gamma^{(n)}(a) = \int_0^{\infty} x^{a-1} e^{-x} (\ln x)^n dx \quad (n = 1, 2, \dots)$$

◀  $\forall a \in (0, +\infty)$  nuqtani olaylik. Unda shunday  $[a_0, a_0]$  ( $0 < a_0 < a_0 < +\infty$ ) oraliq topiladi,  $a \in [a_0, a_0]$  bo'ladi.

Ravshanki,

$$\Gamma(a) = \int_0^{\infty} x^{a-1} e^{-x} dx$$

integral ostidagi  $f(x, a) = x^{a-1} e^{-x}$  funksiya  $M = \{(x, a) \in R^2 : x \in (0, +\infty), a \in (0, +\infty)\}$  to'plamda uzuksiz funksiyadir. (16.34) integral esa (yuqorida isbot etilishiga ko'ra)  $[a_0, a_0]$  da tekis yaqinlashuvchi. U holda 4-teoremgaga asosan  $\Gamma(a)$  funksiya  $[a_0, a_0]$  da, binobarin,  $a$  nuqtada uzuksiz bo'ladi.

(16.34) integral ostidagi  $f(x, a) = x^{a-1} e^{-x}$  funksiya

$$f_a'(x, a) = x^{a-1} e^{-x} \ln x$$

hosilasining  $M$  to'plamda uzlusiz funksiya ekanligini payqash qiyin emas.

Endi

$$\int_0^{\infty} f_a'(x, a) dx = \int_0^{\infty} x^{a-1} e^{-x} \ln x dx$$

integralni  $[a_0, \infty)$  da tekis yaqinlashuvchi bo'lishini ko'rsatamiz.

Ushbu  $\int_0^{\infty} x^{a-1} e^{-x} \ln x dx$  integral ostidagi  $x^{a-1} e^{-x} \ln x$  funksiya uchun  $0 < x < 1$

da  $|x^{a-1} e^{-x} \ln x| \leq x^{a_0-1} |\ln x|$  tengsizlik o'rinnlidir.  $\psi_1(x) = x^2 |\ln x|$  funksiya  $0 < x \leq 1$

da chegaralanganligidan va  $\int_0^{\frac{a_0}{2}-1} x^{\frac{a_0}{2}-1} dx$  integralning yaqinlashuvchiligidan

$\int_0^{a_0-1} |x^{a-1} \ln x| dx$  ning ham yaqinlashuvchi bo'lishini va Veyershtrass alomatiga ko'ra

qaralayotgan  $\int_0^{\infty} x^{a-1} e^{-x} \ln x dx$  integralning tekis yaqinlashuvchiligini topamiz.

Shunga o'xshash quyidagi

$$\int_0^{\infty} x^{a-1} e^{-x} \ln x dx$$

integralda, integral ostidagi  $x^{a-1} e^{-x} \ln x$  funksiya uchun barcha  $x \geq 1$  da

$$x^{a-1} e^{-x} \ln x \leq x^{a_0-1} e^{-x} \ln x < x^{a_0} e^{-x} \leq \left( \frac{a_0 + 2}{e} \right)^{a_0+2} \frac{1}{x^2}$$

bo'lib.

$$\int_1^{\infty} \frac{dx}{x^2}$$

integralning yaqinlashuvchiligidan, yana Veyershtrass alomatiga ko'ra

$\int_1^{\infty} x^{a-1} e^{-x} \ln x dx$  ning tekis yaqinlashuvchiligi kelib chiqadi. Demak,  $[a_0, \infty)$  da

$\int_0^{\infty} x^{a-1} e^{-x} \ln x dx$  integral tekis yaqinlashuvchi. Unda 16-teoremagaga asosan

$$\Gamma'(a) = \left( \int_0^{\infty} x^{a-1} e^{-x} dx \right)' = \int_0^{\infty} (x^{a-1} e^{-x})'_a dx = \int_0^{\infty} x^{a-1} e^{-x} \ln x dx$$

bo'ladi va  $\Gamma'(a)$   $[a_0, \infty)$  da binobarin,  $a$  nuqtada uzlusizdir.

Xuddi shu yo'l bilan  $\Gamma(a)$  funksiyaning ikkinchi, uchinchi va hokazo tartibdagi hosilalarining mavjudligi, uzlusizligi hamda

$$\Gamma^{(n)}(a) = \int_0^\infty x^{a-1} e^{-x} (\ln x)^n dx \quad (n = 1, 2, \dots)$$

bo'lishi ko'rsatiladi. ►

3)  $\Gamma(a)$  funksiya uchun ushbu

$$\Gamma(a+1) = a\Gamma(a) \quad (a > 0)$$

formula o'rini.

◀ Haqiqatdan ham,

$$\Gamma(a) = \int_0^\infty x^{a-1} e^{-x} dx = \int_0^\infty e^{-x} d\left(\frac{x^a}{a}\right)$$

integralni bo'laklab integrallasak,

$$\Gamma(a) = e^{-x} \left. \frac{x^a}{a} \right|_0^\infty + \int_0^\infty \frac{x^a}{a} e^{-x} dx = \frac{1}{a} \Gamma(a+1)$$

bo'lib, undan

$$\Gamma(a+1) = a\Gamma(a) \quad (16.35)$$

bo'lishi kelib chiqadi. ►

Bu formula yordamida  $\Gamma(a+n)$  ni topish mumkin. Darhaqiqat, (16.35) formulani takror qo'llab

$$\Gamma(a+2) = (a+1)\Gamma(a+1).$$

$$\Gamma(a+3) = (a+2)\Gamma(a+2),$$

$$\Gamma(a+n) = (a+n-1)\Gamma(a+n-1)$$

bo'lishini, ulardan esa

$$\Gamma(a+n) = (a+n-1)(a+n-2) \dots (a+2)(a+1)a\Gamma(a)$$

ekanligini topamiz. Xususan,  $a=1$  bo'lganda

$$\Gamma(n+1) = n(n-1) \dots 2 \cdot 1 \Gamma(1)$$

bo'ladi. Agar  $\Gamma(1) = \int_0^\infty e^{-x} dx = 1$  bo'lishini e'tiborga olsak, unda  $\Gamma(n+1) = n!$

ekanligi kelib chiqadi.

Yana (16.35) formuladan foydalanib  $\Gamma(2) = \Gamma(1) = 1$  bo'lishini topamiz.

4)  $\Gamma(a)$  funksiyaning o'zgarish xarakteri.

$\Gamma(a)$  funksiya  $(0, +\infty)$  oraliqda berilgan bo'lib, shu oraliqda istalgan tartibli hosilaga ega. Bu funksiyaning  $a=1$  va  $a=2$  nuqtalardagi qiymatlari bir-biriga teng:

$$\Gamma(1) = \Gamma(2) = 1$$

$\Gamma(a)$  funksiyaga Roll teoremasini (qaralsin, 1-qism, 6-bob, 6-§) tatbiq qila olamiz, chunki yuqorida keltirilgan faktlar Roll teoremasi shartlarining bajarilishini ta'minlaydi. Demak, Roll teoremasiga ko'ra, shunday  $a^* (1 < a^* < 2)$  topiladiki,  $\Gamma'(a^*) = 0$  ho'ladi.

$$\forall a \in (0, +\infty) \text{ da}$$

$$\Gamma''(a) = \int_0^a x^{a-1} e^{-x} \ln^2 x \, dx > 0$$

bo'lishi sababli,  $\Gamma'(a)$  funksiya  $(0, +\infty)$  oraliqda qat'iy o'suvchi bo'ldi. Demak,  $\Gamma'(a)$  funksiya  $(0, +\infty)$  da  $a^*$  nuqtadan boshqa nuqtalarda nolga aylanmaydi, ya'ni

$$\Gamma'(a) = \int_0^a x^{a-1} e^{-x} \ln x \, dx = 0$$

tenglama  $(0, +\infty)$  oraliqda  $a^*$  dan boshqa echimga ega emas. U holda

$$0 < a < a^* \text{ da } \Gamma'(a) < 0$$

$$a^* < a < +\infty \text{ da } \Gamma'(a) > 0$$

bo'ldi. Demak  $\Gamma(a)$  funksiya  $a^*$  nuqtada minimumga ega. Uning minimum qiymati  $\Gamma(a^*)$  ga teng.

Taqribihi hisoblash usuli bilan

$$a^* = 1.4616\dots, \Gamma(a^*) = \min \Gamma(a) = 0.8856$$

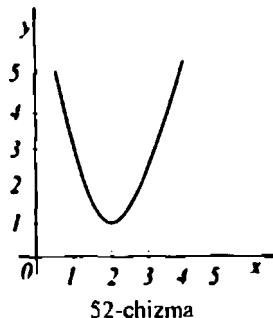

bo'lishi topilgan.

$\Gamma(a)$  funksiya  $a > a^*$  da o'suvchi bo'lganligi sababli  $a > n+1$  ( $n \in N$ ) bo'lganda  $\Gamma(a) > \Gamma(n+1) = n!$  bo'lib, undan

$$\lim_{a \rightarrow +\infty} \Gamma(a) = +\infty$$

bo'lishini topamiz.

Ikkinci tomondan,  $a \rightarrow 0$  da  $\Gamma(a+1) \rightarrow \Gamma(1) = 1$  hamda  $\Gamma(a) = \frac{\Gamma(a+1)}{a}$  ekanligidan  $\lim_{a \rightarrow 0^+} \Gamma(a) = +\infty$  kelib chiqadi.  $\Gamma(a)$  funksiyaning grafigi 52-chizmada tasvirlangan.

52-chizma

3<sup>o</sup>. Beta va gamma funksiyalar orasidagi bog'lanish. Biz quyida  $B(a, b)$  va  $\Gamma(a)$  funksiyalar orasidagi bog'lanishni ifodalaydigan formulani keltiramiz.

Ma'lumki,  $\Gamma(a)$  funksiya  $(0, +\infty)$  da,  $B(a, b)$  funksiya esa  $R^2$  fazodagi  $M = \{(x, y) \in R^2 : a \in (0, +\infty), b \in (0, +\infty)\}$  to'plamida berilgan.

21-teorema.  $\forall (a, b) \in M$  uchun

$$B(a, \sigma) = \frac{\Gamma(a)\Gamma(\sigma)}{\Gamma(a+\sigma)}$$

formula o'rinnlidir.

► Ushbu  $\Gamma(a+\sigma) = \int_0^\infty x^{a+\sigma-1} e^{-x} dx$  ( $a > 0, \sigma > 0$ ) gamma funksiyada o'zgaruvchini almashtiramiz:

$$x = (1+t)y \quad (t > 0).$$

Natijada

$$\Gamma(a+\sigma) = \int_0^\infty (1+t)^{a+\sigma-1} y^{a+\sigma-1} e^{-(1+t)y} (1+t) dy = (1+t)^{a+\sigma-1} \int_0^\infty y^{a+\sigma-1} e^{-(1+t)y} dy.$$

bo'ladi.

Keyingi tenglikdan quyidagini topamiz:

$$\frac{\Gamma(a+\sigma)}{(1+t)^{a+\sigma}} = \int_0^\infty y^{a+\sigma-1} e^{-(1+t)y} dy.$$

Bu tenglikning har ikki tomonini  $t^{\sigma-1}$  ga ko'paytirib, natijani  $(0, +\infty)$  oraliq bo'yicha integrallaymiz:

$$\Gamma(a+\sigma) \cdot \int_0^\infty \frac{t^{\sigma-1}}{(1+t)^{a+\sigma}} dt = \int_0^\infty \left( \int_0^\infty y^{a+\sigma-1} e^{-(1+t)y} dy \right) t^{\sigma-1} dt.$$

Agar

$$\int_0^\infty \frac{t^{\sigma-1}}{(1+t)^{a+\sigma}} dt = B(a, \sigma)$$

ekanini e'tiborga olsak, unda

$$\Gamma(a+\sigma) B(a, \sigma) = \int_0^\infty \left( \int_0^\infty y^{a+\sigma-1} e^{-(1+t)y} dy \right) t^{\sigma-1} dt \quad (16.36)$$

bo'ladi. Endi (16.36) tenglikning o'ng tomonidagi integral  $\Gamma(a) \cdot \Gamma(\sigma)$  ga teng bo'lishini isbotlaysiz. Uning uchun, avvalo bu integrallarda integrallash tartibini almashtirish mumkinligini ko'rsatamiz. Buning uchun 19-teorema shartlari bajarilishini ko'rsatishimiz kerak.

Dastlab  $a > 1, \sigma > 1$  bo'lgan holni ko'raylik.

$a > 1, \sigma > 1$  da, ya'ni  $\{(a, \sigma) \in R^2 : a \in (1, +\infty), \sigma \in (1, +\infty)\}$  to'plamda integral ostidagi

$$f(t, y) = y^{a+\sigma-1} t^{\sigma-1} e^{-(1+t)y}$$

funksiya  $\forall (t, y) \in \{(t, y) \in R^2 : t \in [0, +\infty), y \in [0, +\infty)\}$  da uzuksiz bo'lib,  $f(t, y) = y^{a+\sigma-1} t^{\sigma-1} e^{-(1+t)y} > 0$  bo'ladi.

Ushbu  $\int_0^\infty f(t, y) dy = \int_0^\infty t^{\sigma-1} y^{a+\sigma-1} e^{-(1+t)y} dy$  integral  $t$  o'zgaruvchining  $[0, +\infty)$  oraliqda uzuksiz funksiyasi bo'ladi, chunki

$$\int_0^{\infty} t^{a-1} y^{s-1} e^{-(1+t)y} dt = \Gamma(a+s) \frac{t^{a-1}}{(1+t)^{a+s}}.$$

Ushbu

$$\int_0^{\infty} f(t, y) dt = \int_0^{\infty} t^{a-1} y^{s-1} e^{-(1+t)y} dt$$

integral y o'zgaruvchining  $[0, +\infty)$  oraliqda uzliksiz funksiyasi bo'ladi, chunki

$$\int_0^{\infty} t^{a-1} y^{s-1} e^{-(1+t)y} dt = \Gamma(a) y^{s-1} e^{-y}$$

va nihoyat, yuqoridagi (16.36) munosabatga ko'ra

$$\int_0^{\infty} \left( \int_0^{\infty} t^{a-1} y^{s-1} e^{-(1+t)y} dt \right) dy$$

integral yaqinlashuvchi.

U holda 19-teoremagaga asosan

$$\int_0^{\infty} \left( \int_0^{\infty} t^{a-1} y^{s-1} e^{-(1+t)y} dt \right) dy$$

integral ham yaqinlashuvchi bo'lib,

$$\int_0^{\infty} \left( \int_0^{\infty} t^{a-1} y^{s-1} e^{-(1+t)y} dt \right) dy = \int_0^{\infty} \left( \int_0^{\infty} t^{a-1} y^{s-1} e^{-(1+t)y} dt \right) dy$$

bo'ladi. O'ng tomondagi integralni hisoblaymiz:

$$\begin{aligned} \int_0^{\infty} \left( \int_0^{\infty} t^{a-1} y^{s-1} e^{-(1+t)y} dy \right) dt &= \int_0^{\infty} \left( \int_0^{\infty} t^{a-1} y^{s-1} e^{-(1+t)y} dt \right) dy = \int_0^{\infty} y^{s-1} e^{-y} \left( \int_0^{\infty} t^{a-1} e^{-t} dt \right) dy = \\ &= \int_0^{\infty} y^{s-1} e^{-y} \frac{1}{y!} \left( \int_0^{\infty} (\eta)^{a-1} e^{-\eta} d(\eta) \right) dy = \int_0^{\infty} y^{s-1} e^{-y} \Gamma(a) dy = \Gamma(a) \Gamma(s) \end{aligned} \quad (16.37)$$

Natijada (16.36) va (16.37) munosabatlardan

$$I(a+s)B(a, s) = \Gamma(a) \Gamma(s)$$

ya'ni

$$B(a, s) = \frac{\Gamma(a) \Gamma(s)}{\Gamma(a+s)} \quad (16.38)$$

bo'lishi kelib chiqadi. Biz bu formulani  $a > 0, s > 0$  bo'lgan hol uchun isbotladik. Endi umumiy holni ko'raylik.

Aytaylik,  $a > 0, s > 0$  bo'lsin. U holda isbot etilgan (16.38) formulaga ko'ra

$$B(a+1, s+1) = \frac{\Gamma(a+1) \Gamma(s+1)}{\Gamma(a+s+2)} \quad (16.39)$$

bo'ladi.

$B(a, s)$  va  $I(a)$  funksiyalarning xossalariidan foydalaniб quyidagini topamiz:

$$B(a+1, s+1) = \frac{a}{a+s+1} B(a, s+1) = \frac{a}{a+s+1} \cdot \frac{s}{a+s} B(a, s).$$

$$\begin{aligned} \Gamma(a+1) &= a\Gamma(a), \quad \Gamma(s+1) = s\Gamma(s), \quad \Gamma(a+s+2) = \\ &= (a+s+1)I(a+s+1) = (a+s+1)(a+s)\Gamma(a+s) \end{aligned}$$

Natijada (16.39) formula quyidagi

$$\frac{as}{(a+s)(a+s+1)} B(a, s) = \frac{\alpha^s \Gamma(a) \alpha^s \Gamma(s)}{(a+s)(a+s+1) \Gamma(a+s)}$$

ko'rinishga keladi. Bu esa (16.38) formula  $a > 0, s > 0$  da ham o'rinni ekanini bildiradi. ►

**1-natija.**  $\forall a \in (0, 1)$  uchun

$$\Gamma(a) \Gamma(1-a) = \frac{\pi}{\sin a \pi}$$

bo'ladi.

◀ Haqiqatdan ham, (16.38) formula  $s = 1 - a$  ( $0 < a < 1$ ) deyilsa, unda

$$B(a, 1-a) = \frac{\Gamma(a) \Gamma(1-a)}{\Gamma(1)}$$

bo'lib,  $B(a, 1-a) = \frac{\pi}{\sin a \pi}$  ( $0 < a < 1$ ) va  $\Gamma(1) = 1$  munosabatlarga muvofiq

$$\Gamma(a) \Gamma(1-a) = \frac{\pi}{\sin a \pi} \quad (0 < a < 1). \quad (16.40)$$

Odatda (16.40) formula keltirish formulasi deb ataladi.

Xususan, (16.40) da  $a = \frac{1}{2}$  deb olsak, unda

$$\Gamma\left(\frac{1}{2}\right) = \sqrt{\pi}$$

bo'lishini topamiz.

**2-natija.** Ushbu

$$\Gamma(a) \Gamma\left(a + \frac{1}{2}\right) = \frac{\sqrt{\pi}}{2^{2a-1}} \Gamma(2a) \quad (a > 0)$$

formula o'rinnidir.

◀ (16.38) munosabatda  $a = s$  deb

$$B(a, a) = \frac{\Gamma(a) \Gamma(a)}{\Gamma(2a)}$$

bo'lishini topamiz. So'ngra

$$B(a, a) = \int_0^1 [x(1-x)]^{a-1} dx = \int_0^1 \left[ \frac{1}{4} - \left( \frac{1}{2} - x \right)^2 \right]^{a-1} dx = 2 \int_0^{\frac{1}{2}} \left[ \frac{1}{4} - \left( \frac{1}{2} - x \right)^2 \right]^{a-1} dx$$

integralda  $\frac{1}{2} - x = \frac{1}{2} \sqrt{t}$  almashtirishni bajarib,

$$B(a, a) = 2 \int_0^{\frac{1}{2}} \left[ \frac{1}{4} (1-t) \right]^{a-1} \frac{1}{4} t^{-\frac{1}{2}} dt = \frac{1}{2^{2a-1}} \int_0^{\frac{1}{2}} t^{\frac{1}{2}-1} (1-t)^{a-1} dt = \frac{1}{2^{2a-1}} B\left(\frac{1}{2}, a\right)$$

ga ega bo'lamiz. Natijada

$$\frac{\Gamma^2(a)}{\Gamma(2a)} = \frac{1}{2^{2a-1}} B\left(\frac{1}{2}, a\right)$$

bo'ladi.

Yana (16.38) formulaga ko'ra

$$B\left(\frac{1}{2}, a\right) = \frac{\Gamma\left(\frac{1}{2}\right)\Gamma(a)}{\Gamma\left(a + \frac{1}{2}\right)} = \sqrt{\pi} \cdot \frac{\Gamma(a)}{\Gamma\left(a + \frac{1}{2}\right)}$$

bo'lib, keyingi munosabatlarda

$$\frac{\Gamma(a)}{\Gamma(2a)} = \frac{1}{2^{2a-1}} \sqrt{\pi} \cdot \frac{1}{\Gamma\left(a + \frac{1}{2}\right)}$$

ekanligi kelib chiqadi. Demak.

$$\Gamma(a)\Gamma\left(a + \frac{1}{2}\right) = \frac{\sqrt{\pi}}{2^{2a-1}} \Gamma(2a). \quad (16.41)$$

Odatda (16.41) formula Lejandr formulasi deb ataladi.

### Mashqlar

16.8. Ushbu

$$M = \{(x, y) \in R^2 : 0 \leq x \leq 1, 0 \leq y \leq 1\}$$

toplama berilgan

$$f(x, y) = x^y$$

funksiyaning  $y \rightarrow 0$  da limit funksiyasi topilsin va unga yaqinlashish notejis bo'lishi ko'rsatilsin.

16.9. Ushbu

$$\int_0^{\infty} f(x, y) dx$$

integral ta'rifni keltirilsin.

16.10. Ushbu

a)  $\int_0^{\infty} e^{-ax} dx = \frac{1}{2} \sqrt{\frac{\pi}{a}} \quad (a > 0)$

b)  $\int_0^{\infty} \frac{\cos ax}{1+x^2} dx = \frac{\pi}{2} e^{-a} \quad (a > 0)$

v)  $\int_0^{\infty} \frac{x \sin ax}{1+x^2} dx = \frac{\pi}{2} e^{-a} \quad (a > 0)$

tengliklar isbotlansin.

16.11. Ushbu

$$\int_0^{\infty} e^{-x} \cos xy dx$$

integralning  $(+\infty, -\infty)$  da u parametr bo'yicha tekis yaqinlashishi ko'rsatilsin.

**16.12. Ushbu**

$$\int_0^1 \ln \Gamma(x) dx$$

integral hisohlansin.

**16.13. Ushbu**

$$\lim_{n \rightarrow \infty} \int_0^{\infty} e^{-nx} dx = 1$$

tenglik isbotlansin.

### Karrali integrallar

Matematika va fanning boshqa tarmoqlarida ko'p o'zgaruvchili funksiyalarning integrallari bilan bog'liq masalalarga duch kelamiz. Binobarin, ularni - karrali integrallarni o'rGANISH vazifasi yuzaga keladi.

Karrali integrallar nazariyasida ham, aniq integrallar nazariyasidagi dek, integralning mavjudligi, uning xossalari, karrali integralni hisoblash, integralning tatlbiqlari o'rGANILADI. Bunda aniq integral haqidagi ma'lumotlardan muttasil foydalana boriladi.

#### *I-S. Tekis shaklning yuzi hamda fazodagi jismning hajmi haqida ba'zi ma'lumotlar*

Aniq integralning tatlbiqlari mavzusida tekis shaklning yuzi hamda jismning hajmi haqida ma'lumotlar keltirilgan edi. Bu tushunchalar karrali integrallar nazariyasida muhimligini inobatga olib, ular to'g'risidagi ta'rif va tasdiqlarni talab darajasida bayon etishni lozim topdik.

Aslida, tekis shaklning yuzi, jismning hajmi tushunchalari matematikada muhim bo'lgan to'plamning o'chovi tushunchasini tekislikdagi shaklga, fazodagi jismga nisbatan aytishidan iborat.

*I'. Tekis shaklning yuzi va uning mavjudligi.* Tekislikda Dekart koordinatalar sistemasi berilgan bo'lsin. Bu tekislikda, sodda yopiq chiziq bilan chegaralangan tekislik qismidan tashkil topgan ( $Q$ ) shaklni (tekislik nuqtalari to'plamini) qaraylik. ( $Q$ ) shaklning chegarasini (sodda yopiq chiziq)  $\partial Q$  bilan,  $(Q) \cup \partial Q$  ni esa ( $Q$ ) bilan belgilaymiz:

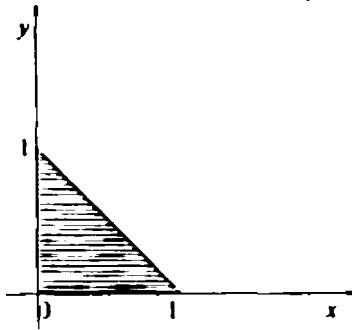

$$(\bar{Q}) = (Q) \cup \partial Q.$$

Masalan, koordinatalari ushbu  $x > 0, y > 0, x + y < 1$

tengsizliklarni qanoatlantiruvchi  $(x, y)$  nuqtalardan tashkil topgan to'plam

$$(\Delta) = \{(x, y) \in R^2 : x > 0, y > 0, x + y < 1\}$$

53-chizmada tasvirlangan uchburchak shaklini ifodalaydi.

$Ox$  o'qidagi birlik kesma ( $0 \leq x \leq 1$ ),  $Oy$  o'qidagi birlik kesma ( $0 \leq y \leq 1$ ) hamda ( $1, 0$ ) va ( $0, 1$ ) nuqtalarni birlashtiruvchi to'g'ri chiziq kesmalari birligida ( $\Delta$ ) uchburchak shaklining chegarasi  $\partial\Delta$  ni tashkil etadi.

Tekislikda uchburchaklar, yopiq siniq chiziq bilan chegaralangan tekislik qismidan tashkil topgan ko'pburchaklar yuzaga ega va ularni topish qoidalari o'quvchiga ma'lum deb hisoblaymiz.

Tekislikda ( $Q$ ) shakl bilan birga ( $A$ ) va ( $B$ ) ko'pburchaklarni olaylik.

Agar ( $A$ ) ko'pburchakning har bir nuqtasi ( $Q$ ) ga tegishli bo'lsa, ( $A$ ) ko'pburchak ( $Q$ ) shaklning ichiga chizilgan deyiladi (bunda ( $A$ )  $\subset$  ( $Q$ )).

Agar ( $Q$ ) ning har bir nuqtasi ( $B$ ) ko'pburchakka tegishli bo'lsa, ( $B$ ) ko'pburchak ( $Q$ ) shaklni o'z ichiga oladi deyiladi (bunda ( $Q$ )  $\subset$  ( $B$ )).

Agar  $A$  va  $B$  lar mos ravishda ( $A$ ) va ( $B$ ) ko'pburchaklarning yuzlari bo'lsa, unda

$$A \leq B \quad (17.1)$$

bo'ladi.

Aytaylik, ( $Q$ ) shaklning ichiga chizilgan ko'pburchaklar yuzalaridan ihorat to'plam  $\{A\}$ , ( $Q$ ) shaklni o'z ichiga olgan ko'pburchaklar yuzalaridan ihorat to'plam  $\{B\}$  bo'lsin. Ravshanki,  $\{A\}$  va  $\{B\}$  lar sonlar to'plami bo'lib,  $\{A\}$  yuqoridan,  $\{B\}$  quyidan chegaralangan. Unda to'plamning aniq chegaralari haqidagi teoremaga ko'ra

$$\sup\{A\} = Q^*, \quad \inf\{B\} = Q^*$$

lar mavjud.

Odatda,  $Q^*$  son ( $Q$ ) shaklning quyi yuzasi,  $Q^*$  son esa ( $Q$ ) shaklning yuqori yuzasi deyiladi.

*Tasdiq.*  $Q^*$  va  $Q^*$  miqdorlar uchun

$$Q^* \leq Q^* \quad (17.2)$$

tengsizlik o'rinni bo'ladi.

◀ Teskarisini faraz qilaylik,  $Q^* > Q^*$  bo'lsin. Bu holda  $Q^* - Q^* > 0$  bo'ladi. Aniq chegara ta'riflariga ko'ra  $\forall \varepsilon > 0$ , jumladan

$$\varepsilon = \frac{1}{2}(Q^* - Q^*)$$

uchun shunday ( $A_0$ )  $\subset$  ( $Q$ ), ( $B_0$ )  $\supset$  ( $Q$ ) ko'pburchaktar topiladiki,

$$A_0 > Q^* - \varepsilon, \quad B_0 < Q^* + \varepsilon$$

tengsizliklar bajariladi. Bu tengsizliklardan foydalaniib topamiz:

$$B_0 - A_0 < Q^* + \varepsilon - (Q^* - \varepsilon) = Q^* - Q^* + 2\varepsilon = Q^* - Q^* + (Q^* - Q^*) = 0.$$

Keyingi tengsizlikdan  $A_0 > B_0$  bo'lishi kelib chiqadi. Bu esa har doim o'rinni bo'lgan (17.1) munosabatga zid. Demak, (17.2) tengsizlik o'rinni. ▶

*I-ta'rif.* Agar

$$Q^* = Q^*$$

tenglik o'tinli bo'lsa,  $(Q)$  shakl yuzaga ega deyiladi.

Ushbu

$$Q_* = Q^*$$

miqdor  $(Q)$  shaklning yuzi deyiladi va uni  $Q$  orqali belgilanadi:

$$Q = Q_* = Q^*.$$

**I-teorema.** Tekislikdag'i  $(Q)$  shakl yuzaga ega bo'lishi uchun  $\forall \varepsilon > 0$  son olinganda ham  $(Q)$  shaklini ichiga chizilgan shunday  $(A)$  ko'pburchak,  $(Q)$  shaklini o'z ichiga olgan shunday  $(B)$  ko'pburchaklar topilib,

$$B - A < \varepsilon \quad (17.3)$$

tengsizlikning bajarilishi zarur va yetarij.

◆ **Zarurligi.** Aytaylik,  $(Q)$  shakl yuzaga ega bo'lsin:

$$Q = Q_* = Q^*.$$

Aniq chegara ta'riflariga ko'ra,  $\forall \varepsilon > 0$  uchun shunday

$$(A) \subset (Q), (B) \supset (Q)$$

ko'pburchaklar topiladiki,

$$A > Q_* - \frac{\varepsilon}{2}, \quad B < Q^* + \frac{\varepsilon}{2}$$

ya'ni

$$A > Q - \frac{\varepsilon}{2}, \quad B < Q + \frac{\varepsilon}{2}$$

bo'ladi. Bu tengsizliklardan

$$B - A < \varepsilon$$

bo'lishi kelib chiqadi.

◆ **Yetarlilikligi.** Aytaylik,  $(A) \subset (Q)$ ,  $(B) \supset (Q)$  ko'pburchaklar uchun

$$B - A < \varepsilon$$

tengsizlik bajarilsin.

Ravshanki.  $A \leq Q_*$ ,  $B \geq Q^*$ . Yuqoridagi (17.2) munosabatdan foydalaniib topamiz:

$$A \leq Q_* \leq Q^* \leq B.$$

Bu va (17.3) tengsizlikka ko'ra

$$Q^* - Q_* \leq B - A < \varepsilon$$

bo'ladi. Demak,  $Q_* = Q^*$ . ▶

Faraz qilaylik, tekislikda  $I$  chiziq (u yopiq yoki yopiq bo'lmasligi mumkin) berilgan bo'lsin.

**2-ta'rif.** Agar shunday  $(A_0)$  ko'pburchak topilsaki,

$$1) I \subset (A_0);$$

$$2) \forall \varepsilon > 0 \text{ uchun } A_0 < \varepsilon \text{ bo'lsa, } I \text{ nol yuzali chiziq deyiladi.}$$

**Tasdiq.** Agar  $I$  chiziq  $[a, a]$  segmentda uzliksiz bo'lgan  $f(x)$  funksiyaning grafigidan iborat bo'lsa, u nol yuzali chiziq bo'ladi.

◆  $\forall \varepsilon > 0$  sonni olib,  $[a, a]$  segmentini shunday

$[x_k, x_{k+1}]$  ( $k = 0, 1, 2, \dots, n-1$ ;  $x_0 = a$ ,  $x_n = b$ )  
bo'laklarga ajratamiz, har bir  $[x_k, x_{k+1}]$  da  $f(x)$  funksiyaning tebranishi

$$\omega_k < \frac{\varepsilon}{b-a}$$

bo'lsin. U holda / chiziqni o'z ichiga olgan  $(A_0)$  ko'pburchakning yuzi

$$A_0 = \sum_{k=0}^{n-1} (M_k - m_k)(x_{k+1} - x_k)$$

bo'ladi, bunda

$$\begin{aligned} M_k &= \sup\{f(x)\}, & x \in [x_k, x_{k+1}] \\ m_k &= \inf\{f(x)\}, & x \in [x_k, x_{k+1}] \end{aligned} \quad (k = 0, 1, 2, \dots, n-1)$$

Ravshanki,

$$A_0 = \sum_{k=0}^{n-1} \omega_k \Delta x_k < \frac{\varepsilon}{b-a} \sum_{k=0}^{n-1} \Delta x_k = \varepsilon \quad (\Delta x_k = x_{k+1} - x_k).$$

Demak, / nol yuzali chiziq. ▶

Bu tushuncha yordamida yuqoridagi 1-teoremani quyidagicha ifodalasa bo'ladi.

**2-teorema.** Tekislikdagi  $(Q)$  shakl yuzaga ega bo'lishi uchun uning chegarasi  $\partial Q$  nol yuzali chiziq bo'lishi zarur va yetarli.

**Natija.** Agar  $(Q)$  shaklning chegarasi  $\partial Q$  har biri  $y = f(x) \in C[a, b]$  yoki  $x = g(y) \in C[c, d]$  funksiyalar tasvirlangan bir nechta egri chiziqlardan tashkil topgan bo'lsa, u holda  $(Q)$  shakl yuzaga ega bo'ladi.

**2<sup>o</sup>. Yuzanining xossalari.** Endi yuzanining asosiy xossalarni keltiramiz.

**I).** Agar tekislikdagi  $(Q_1)$ ,  $(Q_2)$  shakllar yuzaga ega bo'lib,  $(Q_1) \subset (Q_2)$  bo'lsa, u holda

$$Q_1 \leq Q_2$$

bo'ladi.

**2).** Agar  $(Q_1)$  va  $(Q_2)$  shakllar yuzaga ega bo'lsa, u holda  $(Q_1) \cup (Q_2)$  ham yuzaga ega bo'lib,  $(Q_1) \cup (Q_2)$  shaklning yuzi  $(Q_1)$  va  $(Q_2)$  shakllar yuzalarining yig'indisidan katta bo'lmaydi.

Agar bu  $(Q_1)$  va  $(Q_2)$  shakllar chegaralaridan boshqa umumiy nuqtaga ega bo'lmasa, ya'ni

$$(Q_1) \cap (Q_2) = \emptyset$$

bo'lsa, u holda  $(Q_1) \cup (Q_2)$  shaklning yuzi  $(Q_1)$  va  $(Q_2)$  shakllar yuzalarining yig'indisiga teng bo'ladi. Bu yuzanining additivlik xossasi deyiladi.

**3<sup>o</sup>. Tekis shaklini bo'laklash.** Tekislikda biror yuzaga ega  $(Q)$  shakl berilgan bo'lib,

$$(Q_1), (Q_2), \dots, (Q_n)$$

shakllar uning yuzaga ega bo'lgan qismiy shakllari, ya'ni

$$(Q_k) \subset (Q) \quad (k = 1, 2, \dots, n)$$

bo'lsin. Agar  $(Q_1), (Q_2), \dots, (Q_n)$  shakllar uchun

1)  $(Q_1) \cup (Q_2) \cup \dots \cup (Q_n) = Q$ ,

2) ixtiyoriy  $(Q_k)$  va  $(Q_i)$  lar ( $k = 1, 2, \dots, n$ ,  $i = 1, 2, \dots, n$ ) umumiy nuqtaga (chegaradagi nuqtalardan boshqa) ega bo'lmasa,  $(Q_1), (Q_2), \dots, (Q_n)$  lar  $(Q)$  da bo'laklash bajaradi yoki  $(Q)$  shakl  $(Q_1), (Q_2), \dots, (Q_n)$  shakllarga bo'laklangan deyiladi.  $(Q)$  shaklini  $(Q_1), (Q_2), \dots, (Q_n)$  larga bo'laklashni  $P$  bilan belgilanadi:

$$P = \{(Q_1), (Q_2), \dots, (Q_n)\}.$$

Ushbu

$$d((Q_k)) = \sup_{((x', y') \in (Q_k), (x'', y'') \in (Q_k))} \rho((x', y'), (x'', y''))$$
$$k = 1, 2, 3, \dots, n$$

miqdorlarning eng kattasi  $P$  bo'laklashning diametri deyiladi va  $\lambda_P$  kabi belgilanadi:

$$\lambda_P = \max_{1 \leq k \leq n} d((Q_k))$$

Masalan, ushbu

$$(Q_k) = \{(x, y) \in R^2 : x_k \leq x \leq x_{k+1}, y_i \leq y \leq y_{i+1}\}$$
$$(k = 0, 1, 2, \dots, n-1, i = 0, 1, 2, \dots, m-1; x_0 = a, x_n = b, y_0 = c, y_m = d)$$

to'g'ri to'rtburchaklar

$$(Q) = \{(x, y) \in R^2 : a \leq x \leq b, c \leq y \leq d\}$$

shaklini  $P$  bo'laklashni hosil qiladi. bunda

$$\lambda_P = \max_{\substack{0 \leq k \leq n-1 \\ 0 \leq i \leq m-1}} \sqrt{\Delta x_k^2 + \Delta y_i^2}$$

$$\Delta x_k = x_{k+1} - x_k, \Delta y_i = y_{i+1} - y_i$$

**4.  $R^3$  fazoda jismning hajmi.**  $R^3$  fazoda Dekart koordinatalar sistemasi berilgan bo'lсин. Bu fazoda, chegaralangan yopiq sirt bilan (yoki bunday sirlarning bir nechasi bilan) o'rалган ( $V$ ) jismni ( $R^3$  fazo qismini) qaraylik. ( $V$ ) jismni o'rab turgan sirtni - ( $V$ ) jismning chegarasini  $\partial V$  bilan,  $(V) \cup \partial V$  ni ( $V$ ) bilan belgilaymiz:

$$(\bar{V}) = (V) \cup \partial V.$$

Masalan, koordinatalari ushbu

$$x^2 + y^2 + z^2 < 1$$

tengsizlikni qanoatlantiruvchi  $(x, y, z)$  nuqtalardan tashkil topgan

$$(S) = \{(x, y, z) \in R^3 : x^2 + y^2 + z^2 < 1\}$$

to'plam, markazi  $(0, 0, 0)$  nuqtada, radiusi 1 ga teng shartni - jismni ifodalaydi. Uning chegarasi

$$\partial S = \{(x, y, z) \in R^3 : x^2 + y^2 + z^2 = 1\}$$

sfera bo'ladi. Bunday jism-shar hajmiga ega va  $V = \frac{4}{3}\pi$  ga teng. Umuman, fazoda ko'pyoqliklarning hajmiga ega bo'lishi va uni topish qoidalari o'quvchiga ma'lum deb hisoblaymiz.

Endi  $R^3$  fazoda ( $V$ ) jism bilan birga ( $F$ ) va ( $G$ ) ko'pyoqlarni qaraymiz.

Agar ( $F$ ) ko'pyoqlikning har bir nuqtasi ( $V$ ) ga tegishli bo'lsa, ( $F$ ) ko'pyoqlik ( $V$ ) jismning ichiga joylashgan deyiladi (bunda ( $F$ )  $\subset$  ( $V$ )).

Agar ( $V$ ) ning har bir nuqtasi ( $G$ ) ko'pyoqlikka tegishli bo'lsa, ( $G$ ) ko'pyoqlik ( $V$ ) jismni o'z ichiga oladi deyiladi (bunda ( $V$ )  $\subset$  ( $G$ )).

Agar  $F$  va  $G$  lar mos ravishda ( $F$ ) va ( $G$ ) ko'pyoqliklarning hajmlari bo'lsa, unda

$$F \leq G$$

bo'ladi.

Aytaylik, ( $V$ ) jismning ichiga joylashgan ko'pyoqliklar hajmlaridan iborat to'plam  $\{F\}$ , jismning o'z ichiga olgan ko'pyoqliklar hajmlaridan iborat to'plam  $\{G\}$  bo'lsin. Unda

$$\sup\{F\} = V_*, \inf\{G\} = V^*$$

lar mavjud.

**3-ta 'rif.** Agar

$$V_* = V^*$$

tenglik o'rinni bo'lsa, ( $V$ ) jism hajmga ega deyiladi. Ushbu

$$V_* = V^*$$

miqdor ( $V$ ) jism hajmga ega deyiladi. Uni  $V$  kabi belgilanadi:

$$V = V_* = V^*$$

Tekis shaklning yuzi, fazodagi jismning hajmi tushunchalarida bir-biriga o'xshashlik borligini inobatga olib, jism hajmining mavjudligi haqidagi teoremani keltirish bilan kifoyalanamiz.

**3-teorema.** Fazodagi ( $V$ ) jism hajmga ega bo'lishi uchun  $\forall \varepsilon > 0$  son olinganda ham ( $V$ ) jismning ichida joylashgan shunday ( $F$ ) ko'pyoqlik, ( $V$ ) jismni o'z ichiga olgan shunday ( $G$ ) ko'pyoqliklar topilib, ular uchun

$$G - F < \varepsilon$$

tengsizlikning bajarilishi zarur va yetarli.

## 2-§. Ikki karrali integral ta'riflari

**I<sup>o</sup>. Integrating ta'rif.** Tekislikda biror chegaralangan ( $D$ ) soha (shakl) berilgan bo'lsin. Bu sohaning bo'laklashlari to'plamini  $\Im$  bilan belgilaymiz.

Aytaylik, ( $D$ ) sohada  $f(x, y)$  aniqlangan. Bu ( $D$ ) sohaning

$$P = \{(D_1), (D_2), \dots, (D_n)\} \subset \Im$$

bo'laklashini va bu bo'laklashning har bir ( $D_k$ ) ( $k = 1, 2, \dots, n$ ) bo'lagida ixtiyoriy ( $\xi_k, \eta_k$ ) ( $k = 1, 2, \dots, n$ ) nuqtani olaylik. Berilgan funksiyaning ( $\xi_k, \eta_k$ ) nuqtadagi qiymati  $f(\xi_k, \eta_k)$  ni  $D_k$  ( $D_k - (D_k)$  sohaning yuzi) ga ko'paytirib, quyidagi

$$\sigma = \sum_{k=1}^n f(\xi_k, \eta_k) D_k$$

yig'indini tuzamiz.

### I-ta'rif. Ushbu

$$\sigma = \sum_{k=1}^n f(\xi_k, \eta_k) D_k$$

yig'indi,  $f(x, y)$  funksiyaning integral yig'indisi yoki Riman yig'indisi deb ataladi.

Masalan,  $f(x, y) = xy$  funksiyaning ( $D$ ) sohaning integral yig'indisi

$$\sigma = \sum_{k=1}^n f(\xi_k, \eta_k) D_k = \sum_{k=1}^n \xi_k \eta_k D_k$$

bo'ladi, bunda

$$(\xi_k, \eta_k) \in (D_k) \quad (k = 1, 2, \dots, n)$$

Yuqorida keltirilgan ta'rifdan ko'rinadiki,  $f(x, y)$  funksiyaning integral yig'indisi  $\sigma$  qaratayotgan  $f(x, y)$  funksiyaga, ( $D$ ) sohaning bo'laklash usuliga ham har bir ( $D_k$ ) dan olingan  $(\xi_k, \eta_k)$  nuqtalarga bog'liq bo'ladi:

$$\sigma_p = \sigma_p(f, \xi_k, \eta_k).$$

Endi ( $D$ ) sohaning shunday

$$P_1, P_2, \dots, P_m. \quad (17.4)$$

bo'laklashlarni qaraymizki, ularning diametrlaridan tashkil topgan

$$\lambda_{P_1}, \lambda_{P_2}, \dots, \lambda_{P_m}.$$

ketma-ketlik nolga intilsin:  $\lambda_{P_m} \rightarrow 0$ . Bunday  $P_m$  ( $m = 1, 2, \dots$ ) bo'laklashlarga nisbatan  $f(x, y)$  funksiyaning integral yig'indisini tuzamiz:

$$\sigma_m = \sum_{k=1}^n f(\xi_k, \eta_k) D_k.$$

Natijada  $D$  sohaning (17.4) bo'laklariga mos  $f(x, y)$  funksiya integral yig'indilari qiymatlaridan iborat quyidagi

$$\sigma_1, \sigma_2, \dots, \sigma_m \dots$$

ketma-ketlik hosil bo'ladi. Bu ketma-ketlikning har bir hadi  $(\xi_k, \eta_k)$  nuqtalarga bog'liq.

**2-ta'rif.** Agar ( $D$ ) sohaning har qanday (17.4) bo'laklashlar ketma-ketligi  $\{P_m\}$  olinganda ham, unga mos integral yig'indi qiymatlaridan iborat  $\{\sigma_m\}$  ketma-ketlik,  $(\xi_k, \eta_k)$  nuqtalarni tanlab olinishiga bog'liq bo'laman holda hamma vaqt bitta  $J$  songa intilsa, bu  $J$  son  $\sigma$  yig'indining limiti deb ataladi va u

$$\lim_{\lambda_P \rightarrow 0} \sigma = \lim_{\lambda_P \rightarrow 0} \sum_{k=1}^n f(\xi_k, \eta_k) D_k = J$$

kabi belgilanadi.

Integral yig'indining limitini quyidagicha ham ta'riflash mumkin.

**3-ta'rif.** Agar  $\forall \varepsilon > 0$  son olinganda ham, shunday  $\delta > 0$  topilsaki, ( $D$ ) sohaning diametri  $\lambda_P < \delta$  bo'lган har qanday  $P$  bo'laklashi hamda har bir ( $D_k$ ) bo'lakdag'i ixtiyoriy  $(\xi_k, \eta_k)$  lar uchun

$$|\sigma - J| < \varepsilon$$

tengsizlik hajarilsa. J son  $\sigma$  yig'indining limiti deb ataladi va u

$$\lim_{\lambda_p \rightarrow 0} \sigma = J$$

kabi belgilanadi.

**4-ta'srif.** Agar  $\lambda_p \rightarrow 0$  da  $f(x,y)$  funksiyaning integral yig'indisi  $\sigma$  chekli limitga ega bo'lsa,  $f(x,y)$  funksiya ( $D$ ) sohada integrallanuvchi (Riman ma'nosida integrallanuvchi) funksiya deyiladi. Bu  $\sigma$  yig'indining chekli limiti  $J$  esa  $f(x,y)$  funksiyaning ( $D$ ) soha bo'yicha ikki karrali integrali (Riman integrali) deyiladi va u

$$\iint_D f(x,y) dD$$

kabi belgilanadi. Demak,

$$\iint_D f(x,y) dD = \lim_{\lambda_p \rightarrow 0} \sigma = \lim_{\lambda_p \rightarrow 0} \sum_{k=1}^n f(\xi_k, \eta_k) D_k.$$

Masalan,  $f(x,y) = C$  ( $C = const$ ) funksiyaning ( $D$ ) soha bo'yicha integral yig'indisi

$$\sigma = \sum_{k=1}^n C \cdot D_k = C \cdot D$$

bo'lib,  $\lambda_p \rightarrow 0$  da  $\lim_{\lambda_p \rightarrow 0} \sigma = CD$  bo'ladi. Demak,

$$\iint_D C dD = CD.$$

Xususan,  $f(x,y) = 1$  bo'lganda

$$\iint_D dD = D$$

bo'ladi.

**1-eslatma.** Agar  $f(x,y)$  funksiya ( $D$ ) sohada chegaralanmagan bo'lsa, u shu sohada integrallanmaydi.

## 2º. Darbu yig'indilari. Ikki karrali integralning boshqacha ta'siflari.

**1). Darbu yig'indilari.**  $f(x,y)$  funksiya ( $D \subset R^2$ ) sohada berilgan bo'lib, u shu sohada chegaralangan bo'lsin. Demak, shunday o'zgarmas  $m$  va  $M$  sonlar mavjudki,  $\forall (x,y) \in (D)$  da

$$m \leq f(x,y) \leq M$$

bo'ladi.

( $D$ ) sohaning biror  $P$  bo'laklashni olaylik. Bu bo'laklashning har bir ( $D_k$ ) ( $k = 1, 2, \dots, n$ ) bo'lagida  $f(x,y)$  funksiya chegaralangan bo'lib, uning aniq chegaralari

$m_k = \inf\{f(x,y) : (x,y) \in (D_k)\}$ ,  $M_k = \sup\{f(x,y) : (x,y) \in (D_k)\}$  mavjud bo'ladi. Ravshanki,  $\forall (x,y) \in (D_k)$  uchun

$$m_k \leq f(x,y) \leq M_k$$

(17.5)

tengsizliklar o'rini.

### S-ta'rif. Ushbu

$$s = \sum_{k=1}^n m_k D_k, \quad S = \sum_{k=1}^n M_k D_k$$

yig'indilar mos ravishda Darbuning quyi hamda yuqori yig'indilari deb ataladi.

Bu ta'rifdan, Darhu yig'indilarining  $f(x, y)$  funksiyaga hamda  $(D)$  sohaning bo'laklashiga bog'liq ekanligi ko'rindi:

$$s = s_p(f), \quad S = S_p(f).$$

Shuningdek, har doim

$$s \leq S$$

bo'ladi.

Yuqoridagi (17.5) tengsizlikdan foydalanib quyidagini topamiz:

$$\sum_{k=1}^n m_k D_k \leq \sum_{k=1}^n f(\xi_k, \eta_k) D_k \leq \sum_{k=1}^n M_k D_k.$$

Demak,

$$s_p(f) \leq \sigma_p(f; \xi_k, \eta_k) \leq S_p(f).$$

Shunday qilib,  $f(x, y)$  funksiyaning integral yig'indisi har doim uning Darbu yig'indilari orasida bo'lar ekan.

Aniq chegaranining xossasiga ko'ra

$$m \leq m_k, \quad M_k < M \quad (k = 1, 2, \dots, n)$$

bo'ladi. Natijada ushu

$$s = \sum_{k=1}^n m_k D_k \geq m \sum_{k=1}^n D_k = mD,$$

$$S = \sum_{k=1}^n M_k D_k \leq M \sum_{k=1}^n D_k = MD$$

tengsizliklarga kelamiz. Demak,  $\forall P \in \mathfrak{P}$  uchun

$$mD \leq s \leq S \leq MD \tag{17.6}$$

bo'ladi. Bu esa Darbu yig'indilarining chegaralanganligini bildiradi.

2) *Ikki karrali integralning hoshqacha ta'risi.*  $f(x, y)$  funksiya  $(D) \subset \mathbb{R}^2$  sohada berilgan bo'lib, u shu sohada chegaralangan bo'lisin.  $(D)$  sohaning bo'laklashlari to'plami  $\mathfrak{P} = \{P\}$  ning har bir  $P \in \mathfrak{P}$  bo'laklashiga nisbatan  $f(x, y)$  funksiyaning Darbu yig'indilari  $s_p(f)$ ,  $S_p(f)$  ni tuzib,

$$\{s_p(f)\}, \{S_p(f)\}$$

to'plamlarni qaraymiz. Bu to'plamlar (17.6) ga ko'ra chegaralangan bo'ladi.

6-ta'rif.  $\{s_p(f)\}$  to'plamning aniq yuqori chegarasi  $f(x, y)$  funksiyaning  $(D)$  sohadagi quyi ikki karrali integrali (quyi Riman integrali) deb ataladi va u

$$\underline{J} = \iint_{(D)} f(x, y) dD$$

kabi belgilanadi.

$\{S_p(f)\}$  to'plamning aniq quyi chegarasi  $f(x, y)$  funksiyaning  $(D)$  sohadagi yuqori ikki karrali integrali (yuqori Riman integrali) deb ataladi va u

$$\bar{J} = \iint_{(D)} f(x, y) dD$$

kabi belgilanadi. Demak,

$$\underline{J} = \iint_{(D)} f(x, y) dD = \sup\{S\}, \quad \bar{J} = \iint_{(D)} f(x, y) dD = \inf\{S\}.$$

**7-ta'rif.** Agar  $f(x, y)$  funksiyaning  $(D)$  sohada quyi hamda yuqori ikki karrali integrallar bir-biriga teng bo'lsa,  $f(x, y)$  funksiya  $(D)$  sohada integrallanuvchi deb ataladi, ularning umumiy qiymati

$$J = \iint_{(D)} f(x, y) dD = \iint_{(D)} f(x, y) dD.$$

$f(x, y)$  funksiyaning  $(D)$  sohadagi ikki karrali integrali (Riman integrali) deyiladi va u

$$\iint_{(D)} f(x, y) dD$$

kabi belgilanadi. Demak,

$$\iint_{(D)} f(x, y) dD = \iint_{(D)} f(x, y) dD = \iint_{(D)} f(x, y) dD.$$

Agar

$$\iint_{(D)} f(x, y) dD \neq \iint_{(D)} f(x, y) dD$$

bo'lsa,  $f(x, y)$  funksiya  $(D)$  sohada integrallanmaydi deb ataladi.

### 3-8. Ikki karrali integralning mavjudligi

$f(x, y)$  funksiyaning  $(D) \subset R^2$  soha bo'yicha ikki karrali integrali mavjudligi masalasini qaraymiz. Buning uchun avvalo  $(D)$  sohaning hamda Darbu yig'indilarining xossalarni keltiramiz.

$(D)$  sohaning bo'laklashlari xossalari 1-qism. 9-bobda o'rganilgan  $[a, e]$  segmentning bo'laklashlari xossalari kabidir. Ularni isbotlash deyarli bir xil mulohaza asosida olib borilishini e'tiborga olib, quyidagi u xossalarni isbotsiz keltirishni lozim topdik.

$f(x, y)$  funksiyaning Darbu yig'indilarini xossalari haqidagi vaziyat ham xuddi shundaydir.

Faraz qilaylik,  $\Im - \{P\} - (D)$  soha bo'laklashlari to'plami bo'lib,  $P_1 \in \Im$ ,  $P'_1 \in \Im$  bo'lsin:

$$\begin{aligned} P_1 &= \{(D_1), (D_2), \dots, (D_n)\} \\ P'_1 &= \{(D'_1), (D'_2), \dots, (D'_n)\}. \end{aligned}$$

Agar  $P_1$  bo'laklashedagi har bir  $(D_i)$  ( $i = 1, 2, \dots, n$ )  $P_2$  bo'laklashedagi biror  $(D'_i)$  ( $i = 1, 2, \dots, n'$ ) ning qismi bo'lsa,  $P_1$  bo'laklash  $P_2$  ni ergashtiradi deyiladi va  $P_1 \subset P_2$ , kabi yoziladi. Ravshanki,  $P_1 \subset P_2$  bo'lsa,

$$\lambda_r \leq \lambda_i,$$

bo'ldi.

**I<sup>6</sup>. Darbu yig'indilarining xossalari.**  $f(x, y)$  funksiya ( $D$ ) sohada berilgan va chegaralangan bo'lisin. ( $D$ ) sohaning  $P$  bo'laklashini olib, bu bo'laklashga nisbatan  $f(x, y)$  funksiyaning integral va Darbu yig'indilarini tuzamiz:

$$\sigma = \sigma_p(f, \xi_k, \eta_k) = \sum_{k=1}^n f(\xi_k, \eta_k) D_k,$$

$$s = s_p(f) = \sum_{k=1}^n m_k D_k,$$

$$S = S_p(f) = \sum_{k=1}^n M_k D_k.$$

1)  $\forall \varepsilon > 0$  olinganda ham  $(\xi_k, \eta_k) \in (D_k)$  nuqtalarni ( $k = 1, 2, \dots, n$ ) shunday tanlab olish mumkinki,

$$0 \leq S_p(f) - \sigma_p(f) < \varepsilon,$$

shuningdek,  $(\xi_k, \eta_k) \in (D_k)$  ( $k = 1, 2, \dots, n$ ) nuqtalarini yana shunday tanlab olish mumkinki.

$$0 \leq \sigma_p(f) - s_p(f) < \varepsilon$$

bo'ldi.

Bu xossa Darbu yig'indilari  $s_p(f)$ ,  $S_p(f)$  lar uchun integral yig'indi  $\sigma_p(f)$  muayyan bo'laklash uchun mos ravishda aniq quyi hamda aniq yuqori chegara bo'lishini bildiradi. ▲

2) Agar  $P_1$  va  $P_2$  lar ( $D$ ) sohaning ikki bo'laklashlari bo'lib,  $P_1 \subset P_2$  bo'lsa, u holda

$$s_{P_1}(f) \leq s_{P_2}(f), \quad S_{P_1}(f) \geq S_{P_2}(f)$$

bo'ldi.

Bu xossa ( $D$ ) sohaning bo'laklashdagi bo'laklar soni orta borganda ularga mos Darbuning quyi yig'indsining kamaymasligi, yuqori yig'indsining esa oshmasligini bildiradi.

3) Agar  $P_1$  va  $P_2$  lar ( $D$ ) sohaning ixtiyoriy ikki bo'laklashlari bo'lib,  $s_p(f)$ ,  $S_p(f)$  va  $s_{P_1}(f)$ ,  $S_{P_1}(f)$  lar  $f(x, y)$  funksiyaning shu bo'laklashlarga nisbatan Darbu yig'indilar bo'lsa, u holda

$$s_{P_1}(f) \leq S_{P_1}(f), \quad s_{P_1}(f) \leq S_p(f)$$

bo'ldi.

Bu xossa, ( $D$ ) sohaning bo'laklashlariga nisbatan tuzilgan quyi yig'indilar to'plami  $\{s_p(f)\}$  ning har bir elementi (yuqori yig'indilar to'plami  $\{S_p(f)\}$  ning har bir elementi) yuqori yig'indilar to'plami  $\{S_p(f)\}$  ning istalgan elementidan (quyi yig'indilar to'plami  $\{s_p(f)\}$  ning istalgan elementidan) katta (kichik) emasligini bildiradi.

4) Agar  $f(x,y)$  funksiya ( $D$ ) sohada berilgan va chegaralangan bo'lsa, u holda

$$\sup\{s_p(f)\} \leq \inf\{S_p(f)\}$$

bo'ladi.

Bu xossa  $f(x,y)$  funksiyaning quyi ikki karrali integrali, uning yuqori ikki karrali integralidan katta emasligini bildiradi:

$$J \leq J_+$$

5) Agar  $f(x,y)$  fu.ksiya ( $D$ ) sohada berilgan va chegaralangan bo'lsa, u holda  $\forall \varepsilon > 0$  olinganda ham, shunday  $\delta > 0$  topiladiki, ( $D$ ) sohaning diametri  $\lambda_p < \delta$  bo'lgan barcha bo'laklashlari uchun

$$\begin{aligned} S_p(f) &< \bar{J} + \varepsilon \quad (0 \leq S_p(f) - \bar{J} < \varepsilon) \\ s_p(f) &> \underline{J} - \varepsilon \quad (0 \leq \underline{J} - s_p(f) < \varepsilon) \end{aligned} \quad (17.7)$$

bo'ladi.

Bu xossa  $f(x,y)$  funksiyaning yuqori hamda quyi integrallari  $\lambda_p \rightarrow 0$  da mos ravishda Darbuning yuqori hamda quyi yig'indilarining limiti ekanligini bildiradi:

$$J = \lim_{\lambda_p \rightarrow 0} S_p(f), \quad J_- = \lim_{\lambda_p \rightarrow 0} s_p(f)$$

*2. Ikki karrali integralning mavjudligi.* Endi ikki karrali integralning mavjud bo'lishining zarur va yetarli shartini (kriteriysini) keltiramiz.

**I-teorema.**  $f(x,y)$  funksiya ( $D$ ) sohada integrallanuvchi bo'lishi uchun,  $\forall \varepsilon > 0$  olinganda ham, shunday  $\delta > 0$  topilib, ( $D$ ) sohaning diametri  $\lambda_p < \delta$  bo'lgan har qanday  $P$  bo'laklashiga nisbatan Darbu yig'indilari

$$S_p(f) - s_p(f) < \varepsilon \quad (17.8)$$

tengsizlikni qanoatlantirilishi zarur va yetarli.

**«Zarurligi.**  $f(x,y)$  funksiya ( $D$ ) sohada integrallanuvchi bo'lsin. Ta'rifga ko'ra

$$J = \underline{J} = \bar{J}$$

bo'ladi, bunda

$$\underline{J} = \sup\{s_p(f)\}, \quad \bar{J} = \inf\{S_p(f)\}.$$

$\forall \varepsilon > 0$  olinganda ham,  $\frac{\varepsilon}{2}$  ga ko'ra shunday  $\delta > 0$  topiladiki, ( $D$ ) sohaning diametri  $\lambda_p < \delta$  bo'lgan har qanday  $P$  bo'laklashiga nisbatan Darbu yig'indilari uchun (17.7) munosabatlarga ko'ra

$$S_p(f) - \bar{J} < \frac{\varepsilon}{2}, \quad \underline{J} - s_p(f) < \frac{\varepsilon}{2}$$

bo'lib, undan

$$S_p(f) - s_p(f) < \varepsilon$$

bo'lishi kelib chiqadi.

**Yetarliligi.**  $\forall \varepsilon > 0$  olinganda ham, shunday  $\delta > 0$  topilib, ( $D$ ) sohaning diametri  $\lambda_p < \delta$  bo'lgan har qanday  $P$  bo'laklashiga nisbatan Darbu yig'indilari uchun

$$S_p(f) - s_p(f) < \varepsilon$$

bo'lsin. Qaralayotgan  $f(x, y)$  funksiya  $(D)$  sohada chegaralangani uchun, uning quyisi hamda yuqori integrallari

$$\underline{J} = \sup\{s_p(f)\}, \quad \bar{J} = \inf\{S_p(f)\}$$

mavjud va

$$\underline{J} \leq J$$

bo'ladi. Ravshanki,

$$s_p(f) \leq \underline{J} \leq J \leq S_p(f).$$

Bu munosabatdan

$$0 \leq \bar{J} - J \leq S_p(f) - s_p(f)$$

bo'lishini topamiz. Demak,  $\forall \varepsilon > 0$  uchun

$$0 \leq \bar{J} - J < \varepsilon$$

bo'lib, undan  $J = \bar{J}$  bo'lishi kelib chiqadi. Bu esa  $f(x, y)$  funksiyaning  $(D)$  sohada integrallanuvchi ekanligini bildiradi. ▶

Agar  $f(x, y)$  funksiyaning  $(D_k)$  ( $k = 1, 2, \dots, n$ ) sohadagi tebranishini  $\omega_k$  bilan belgilasak, u holda

$$S_p(f) - s_p(f) = \sum_{k=1}^n (M_k - m_k) D_k = \sum_{k=1}^n \omega_k D_k$$

bo'lib, teoremadagi (17.8) shart ushbu

$$\sum_{k=1}^n \omega_k D_k < \varepsilon$$

ya'ni

$$\lim_{n \rightarrow +\infty} \sum_{k=1}^n \omega_k D_k = 0$$

ko'rinishlarni oladi.

#### 4-8. Integrallanuvchi funksiyalar sinfi

Ushbu paragrafda ikki karrali integralning mavjudligi haqidagi teoremedan foydalanim. ma'lum sinif funksiyalarining integrallanuvchi bo'lishini ko'rsatamiz.

**2-teorema.** Agar  $f(x, y)$  funksiya chegaralangan yopiq  $(D) \subset R^2$  sohada berilgan va uzlusiz bo'lsa, u shu sohada integrallanuvchi bo'ladi.

◀  $f(x, y)$  funksiya  $(D)$  sohada tekis uzlusiz bo'ladi. U holda Kantor teoremasining natijasiga asosan,  $\forall \varepsilon > 0$  olinganda ham, shunday  $\delta > 0$  topiladiki.  $(D)$  sohaning diametri  $\lambda_p < \delta$  bo'lgan har qanday  $P$  bo'laklashida

$$S_p(f) - s_p(f) = \sum_{k=1}^n \omega_k D_k < \varepsilon \sum_{k=1}^n D_k = \varepsilon D$$

bo'lib, undan

$$\lim_{n \rightarrow +\infty} \sum_{k=1}^n \omega_k D_k = 0$$

bo'lishi kelib chiqadi. Demak,  $f(x, y)$  funksiya  $(D)$  sohada integrallanuvchi. ▶

$(D)$  sohada nol yuzli  $F$  chiziq berilgan bo'lsin.

**I-lemma.**  $\forall \varepsilon > 0$  olinganda ham, shunday  $\delta > 0$  topiladiki, ( $D$ ) sohaning diametri  $\lambda_p < \delta$  bo'lgan  $P$  bo'laklashi olinganda bu bo'laklashning  $\Gamma$  chiziq bilan umumiy nuqtaga ega bo'lgan bo'laklari yuzlarining yig'indisi  $\varepsilon$  dan kichik bo'ladi.

◀ Shartga ko'ra  $\Gamma$ -nol yuzli chiziq. Demak, uni shunday ( $Q$ ) ko'pburchak bilan o'rash mumkinki, bu ko'pburchakning yuzi  $Q < \varepsilon$  bo'ladi.

$\Gamma$  chiziq bilan ( $Q$ ) ko'pburchak chegarasi umumiy nuqtaga ega emas deb.  $\Gamma$  chiziq nuqtalari bilan ( $Q$ ) ko'pburchak chegarasi nuqtalari orasidagi masofani qaraylik. Bu nuqtalar orasidagi masofa o'zining eng kichik qiymatiga erishadi. Biz uni  $\delta > 0$  orqali belgilaymiz. Agar ( $D$ ) sohaning diametri  $\lambda_p < \delta$  bo'lgan  $P$  bo'laklashi olinsa, ravshanki, bu bo'laklashning  $\Gamma$  chiziq bilan umumiy nuqtaga ega bo'lgan bo'laklari butunlay ( $Q$ ) ko'pburchakda joylashadi. Demak, hunday bo'laklar yuzlarining yig'indisi  $\varepsilon$  dan kichik bo'ladi. ▶

**3-teorema.** Agar  $f(x,y)$  funksiya ( $D$ ) sohada chegaralangan va bu sohaning chekli sondagi nol yuzli chiziqlarida uzilishga ega bo'lib, qolgan barcha nuqtalarida uzlusiz bo'lsa, funksiya ( $D$ ) sohada integrallanuvchi bo'ladi.

◀  $f(x,y)$  funksiya ( $D$ ) sohada chegaralangan bo'lib, u shu sohaning faqat bitta nol yuzli  $\Gamma$  chiziq'ida ( $\Gamma \subset (D)$ ) uzilishga ega bo'lib qolgan barcha nuqtalarda uzlusiz bo'lsin.

$\forall \varepsilon > 0$  sonni olib,  $\Gamma$  chiziqni yuzi  $\varepsilon$  dan kichik bo'lgan ( $Q$ ) ko'pburchak bilan o'raymiz. Natijada ( $D$ ) soha ( $Q$ ) va ( $D \setminus Q$ ) sohalarga ajraladi.

Shartga ko'ra,  $f(x,y)$  funksiya ( $D \setminus Q$ ) da uzlusiz. Demak,  $\forall \varepsilon > 0$  olinganda ham shunday  $\delta_1 > 0$  topiladiki, diametri  $\lambda_p < \delta_1$  bo'lgan  $P_1$  bo'laklashning har bir bo'lqidagi  $f(x,y)$  funksiyaning tebranishi  $\omega_k < \varepsilon$  bo'ladi.

Yuqoridagi lemmanning isbot jarayoni ko'ssatadiki. shu  $\varepsilon > 0$  ga ko'ra, shunday  $\delta_2 > 0$  topiladiki, ( $D$ ) sohaning diametri  $\lambda_p < \delta_2$  bo'lgan bo'laklashi olinsa, bu bo'laklashning ( $Q$ ) ko'pburchak bilan umumiy nuqtaga ega bo'lgan bo'laklar yuzlarining yig'indisi  $\varepsilon$  dan kichik bo'ladi.

Endi  $\min\{\delta_1, \delta_2\} = \delta$  deb, ( $D$ ) sohaning diametri  $\lambda_p < \delta$  bo'lgan  $P$  bo'laklashini olamiz. Bu bo'laklashga nisbatan  $f(x,y)$  funksiyaning Darbu yig'indilarini tuzib, quyidagi

$$S_p(f) - s_p(f) = \sum_{k=1}^n \omega_k D_k \quad (17.9)$$

ayirmani qaraymiz.

Bu (17.9)yig'indining ( $Q$ ) ko'pburchakdan tashqari joylashgan ( $D_k$ ) bo'laklarga mos hadlaridan iborat yig'indi

$$\sum_k \omega_k D_k$$

bo'lsin.

(17.9) yig'indining qolgan barcha hadlaridan tashkil topgan yig'indi

$$\sum_k \omega_k D_k$$

bo'lsin. Natijada (17.9) yig'indi ikki qismga ajraladi:

$$\sum_{k=1}^n \omega_k D_k = \sum_k \omega_k D_k + \sum_k \omega_k D_k \quad (17.10)$$

$(D) \setminus \{Q\}$  sohadagi bo'laklarda  $\omega_k < \varepsilon$  bo'lganligidan

$$\sum_k \omega_k D_k < \varepsilon \sum_k D_k \leq \varepsilon D \quad (17.11)$$

bo'ladi.

Agar  $f(x,y)$  funksiyaning  $(D)$  sohadagi tebranishini  $\Omega$  bilan belgilasak. u holda

$$\sum_k \omega_k D_k \leq \Omega \sum_k D_k$$

bo'ladi.  $\{Q\}$  ko'pburchakda butunlay joylashgan  $P$  bo'laklashning bo'laklari yuzlarining yig'indisi  $\varepsilon$  dan kichik hamda  $\{Q\}$  ko'pburchak chegarasi bilan umumiy nuqtaga ega bo'lgan bo'laklar yuzlarining yig'indisi ham  $\varepsilon$  dan kichik bo'lishini e'tiborga olsak, unda

$$\sum_k D_k < 2\varepsilon$$

bo'lishini topamiz. Demak,

$$\sum_k \omega_k D_k < 2\Omega\varepsilon. \quad (17.12)$$

Natijada, (17.10), (17.11) va (17.12) munosabatlardan

$$\sum_k \omega_k D_k < \varepsilon D + 2\Omega\varepsilon = \varepsilon(D + 2\Omega)$$

ekanligi kelib chiqadi. Demak,

$$\lim_{\Delta_p \rightarrow 0} \sum_{k=1}^n \omega_k D_k = 0.$$

Bu esa  $f(x,y)$  funksiyaning  $(D)$  sohada integrallanuvchi bo'lishini bildiradi.

$f(x,y)$  funksiya  $(D)$  sohaning chekli sondagi nol yuzli chiziqlarida uzilishga ega bo'lib, harcha nuqtalarida uzlusiz bo'lsa, uning  $(D)$  da integrallanuvchi bo'lishi yuqoridagidek isbot etiladi. ▶

### 5-8. Ikki karrali integralning xossalari

Quyida  $f(x,y)$  funksiya ikki karrali integralining xossalarni o'rGANAMIZ.

Ikki karrali integral ham aniq integralning xossalari singari xossalarga ega. Ularni asosan isbotsiz keltiramiz.

1)  $f(x,y)$  funksiya  $(D)$  sohada  $((D) \subset R^2)$  integrallanuvchi bo'lsin. Bu funksiyaning  $(D)$  sohaga tegishli bo'lgan nol yuzli  $L$  chiziqdagi  $(L \subset (D))$  qiymatlarinigina (chegaralanganligini saqlagan holda) o'zlashtirishdan hosil bo'lgan  $F(x,y)$  funksiya ham  $(D)$  sohada integrallanuvchi bo'lib.

$$\iint_D f(x, y) dD = \iint_D F(x, y) dD$$

bo'ladi.

◀ Ravshanki,  $\forall (x, y) \in (D) \setminus L$  uchun  
 $f(x, y) = F(x, y)$ .

Shartga ko'ra  $L$  nol yuzli chiziq. Unda 1-lemmaga asosan,  $\forall \varepsilon > 0$  olinganda ham shunday  $\delta > 0$  topiladiki,  $(D)$  soha diametri  $\lambda_p < \delta$  bo'lgan har qanday  $P$  bo'laklashi olinganda ham, bu bo'laklashning  $L$  chiziq bilan umumiyluqtaga ega bo'ligan bo'laklari yuzlarining yig'indisi  $\varepsilon$  dan kichik bo'ladi. Shu  $P$  bo'laklashga nisbatan  $f(x, y)$  va  $F(x, y)$  funksiyalarning ushbu integral yig'indilarini tuzamiz:

$$\sigma_p(f) = \sum_{k=1}^n f(\xi_k, \eta_k) D_k,$$

$$\sigma_p(F) = \sum_{k=1}^n F(\xi_k, \eta_k) D_k.$$

$\sigma_p(f)$  yig'indini quyidagicha ikki qismga ajratamiz:

$$\sigma_p(f) = \sum_k f(\xi_k, \eta_k) D_k + \sum_k f(\xi_k, \eta_k) D_k$$

bunda  $\sum_k$  yig'indi  $L$  chiziq bilan umumiyluqtaga ega bo'ligan ( $D_k$ ) bo'laklar

bo'yicha olingen,  $\sum_k$  esa qolgan barcha hadlardan tashkil topgan yig'indi.

Xuddi shunga o'xshash

$$\sigma_p(F) = \sum_k F(\xi_k, \eta_k) D_k + \sum_k F(\xi_k, \eta_k) D_k.$$

Agar  $\forall (x, y) \in (D) \setminus L$  uchun  $f(x, y) = F(x, y)$  ekanini e'tiborga olsak, u holda

$$|\sigma_p(f) - \sigma_p(F)| = \sum_k |f(\xi_k, \eta_k) - F(\xi_k, \eta_k)| D_k \leq M \sum_k D_k < M\varepsilon$$

bo'llishi kelib chiqadi. bunda  $M = \sup |f(x, y) - F(x, y)| ((x, y) \in (D) \setminus L)$ . Demak,

$$|\sigma_p(f) - \sigma_p(F)| < M\varepsilon.$$

Keyingi tengsizlikda  $\lambda_p \rightarrow 0$  da limitiga o'tib quyidagini topamiz:

$$\iint_D f(x, y) dD = \iint_D F(x, y) dD. ▶$$

2)  $f(x, y)$  funksiya  $(D)$  sohada berilgan bo'lib,  $(D)$  soha nol yuzli  $L$  chiziq bilan  $(D_1)$  va  $(D_2)$  sohalarga ajralgan bo'lsin. Agar  $f(x, y)$  funksiya  $(D)$  sohada integrallanuvchi bo'lsa, funksiya  $(D_1)$  va  $(D_2)$  sohalarda ham integrallanuvchi bo'ladi. Va aksincha, ya'ni  $f(x, y)$  funksiya  $(D_1)$  va  $(D_2)$  sohalarning har birida integrallanuvchi bo'lsa,  $(D)$  sohada ham integrallanuvchi bo'ladi. Bunda

$$\iint_D f(x, y) dD = \iint_{(D_1)} f(x, y) dD + \iint_{(D_2)} f(x, y) dD$$

3) Agar  $f(x, y)$  funksiya ( $D$ ) sohada integrallanuvchi bo'lsa, u holda  $cf(x, y)$  ( $c = const$ ) ham shu sohada integrallanuvchi va ushbu

$$\iint_D cf(x, y)dD = c \iint_D f(x, y)dD$$

formula o'rini bo'ladi.

4) Agar  $f(x, y)$  va  $g(x, y)$  funksiyalar ( $D$ ) sohada integrallanuvchi bo'lsa, u holda  $f(x, y) \pm g(x, y)$  funksiya ham shu sohada integrallanuvchi va ushbu

$$\iint_D (f(x, y) \pm g(x, y))dD = \iint_D f(x, y)dD \pm \iint_D g(x, y)dD$$

formula o'rini bo'ladi.

*1-natija.* Agar  $f_1(x, y), f_2(x, y), \dots, f_n(x, y)$  funksiyalarning har biri ( $D$ ) sohada integrallanuvchi bo'lsa, u holda ushbu

$$c_1 f_1(x, y) + c_2 f_2(x, y) + \dots + c_n f_n(x, y) \quad (c_i = const, \quad i = 1, 2, \dots, n)$$

funksiya ham shu sohada integrallanuvchi va

$$\begin{aligned} & \iint_D (c_1 f_1(x, y) + c_2 f_2(x, y) + \dots + c_n f_n(x, y))dD = \\ & = c_1 \iint_D f_1(x, y)dD + c_2 \iint_D f_2(x, y)dD + \dots + c_n \iint_D f_n(x, y)dD \end{aligned}$$

bo'ladi.

5) Agar  $f(x, y)$  funksiya ( $D$ ) sohada integrallanuvchi bo'lib,  $\forall (x, y) \in (D)$  uchun  $f(x, y) > 0$  bo'lsa, u holda

$$\iint_D f(x, y)dD \geq 0$$

bo'ladi.

*2-natija.* Agar  $f(x, y)$  va  $g(x, y)$  funksiyalar ( $D$ ) sohada integrallanuvchi bo'lib,  $\forall (x, y) \in (D)$  uchun

$$f(x, y) < g(x, y)$$

bo'lsa, u holda

$$\iint_D f(x, y)dD \leq \iint_D g(x, y)dD$$

bo'ladi.

6) Agar  $f(x, y)$  funksiya ( $D$ ) sohada integrallanuvchi bo'lsa, u holda  $|f(x, y)|$  funksiya ham shu sohada integrallanuvchi va

$$\left| \iint_D f(x, y)dD \right| \leq \iint_D |f(x, y)|dD$$

bo'ladi.

*7) O'rta qiymat haqidagi teoremlar.*  $f(x, y)$  funksiya ( $D$ ) sohada berilgan va u shu sohada chegaralangan bo'lsin. Demak, shunday  $m$  va  $M$  o'zgarmas sonlar  $m = \inf\{f(x, y), (x, y) \in (D)\}$ ,  $M = \sup\{f(x, y), (x, y) \in (D)\}$  mavjudki,  $\forall (x, y) \in (D)$  uchun

$$m \leq f(x, y) \leq M$$

bo'ladi.

**4-teorema.** Agar  $f(x, y)$  funksiya ( $D$ ) sohada integrallanuvchi bo'lsa, u holda shunday o'zgarmas  $\mu$  ( $m \leq \mu \leq M$ ) son mavjudki.

$$\iint_D f(x, y) dD = \mu \cdot D$$

bo'ladi, bunda  $D - (D)$  sohaning yuzi.

**3-natija.** Agar  $f(x, y)$  funksiya yopiq ( $D$ ) sohada uzlusiz bo'lsa, u holda bu sohada shunday  $(a, \varepsilon) \in (D)$  nuqta topiladiki,

$$\iint_D f(x, y) dD = f(a, \varepsilon) dD$$

bo'ladi.

**5-teorema.** Agar  $g(x, y)$  funksiya ( $D$ ) sohada integrallanuvchi bo'lib, u shu sohada o'z ishorasini o'zgartirmasa va  $f(x, y)$  funksiya ( $D$ ) sohada uzlusiz bo'lsa, u holda shunday  $(a, \varepsilon) \in (D)$  nuqta topiladiki,

$$\iint_D f(x, y) g(x, y) dD = f(a, \varepsilon) \iint_D g(x, y) dD$$

bo'ladi.

8) **Integralash sohasi o'zgaruvchi bo'lgan ikki karrali integrallar.**  $f(x, y)$  funksiya ( $D$ ) sohada berilgan bo'lib, u shu sohada integrallanuvchi bo'lsin. Bu funksiya, ( $D$ ) sohaning yuzga ega bo'lgan har qanday  $(d)$  qismida  $((d) \subset (D))$  ham integrallanuvchi bo'ladi. Ravshanki, ushbu

$$\iint_{(d)} f(x, y) dD$$

integral  $(d)$  ga bog'liq bo'ladi.

$(D)$  sohaning yuzga ega bo'lgan har bir  $(d)$  qismiga yuqoridagi integralni mos qo'yamiz:

$$\Phi_{+}(d) \rightarrow \iint_{(d)} f(x, y) dD.$$

Natijada funksiya hosil bo'ladi. Odatda bu

$$\Phi((d)) = \iint_{(d)} f(x, y) dD$$

funksiya sohaning funksiyasi deb ataladi.

$(D)$  sohada biror  $(x_0, y_0)$  nuqtani olaylik.  $(d)$  esa shu nuqtani o'z ichiga olgan va  $(d) \subset (D)$  bo'lgan soha bo'lsin. Bu sohaning yuzi  $d$  diametri esa  $\lambda$  bo'lsin.

Agar  $\lambda \rightarrow \infty$  da  $\frac{\Phi((d))}{d}$  nisbatning limiti  $\lim_{\lambda \rightarrow \infty} \frac{\Phi((d))}{d}$  mavjud va chekli bo'lsa, bu limit  $\Phi((d))$  funksiyaning  $(x_0, y_0)$  nuqtadagi soha bo'yicha hosilasi deb ataladi.

Agar  $f(x, y)$  funksiya ( $D$ ) sohada uzlusiz bo'lsa, u holda  $\Phi((d))$  funksiyaning  $(x_0, y_0)$  nuqtadagi soha bo'yicha hosilasi  $f(x_0, y_0)$  ga teng bo'ladi.

### 6-§. Ikki karrali integralarni hisoblash

$f(x, y)$  funksiyaning  $(D)$  sohadagi  $((D) \subset R^2)$  ikki karrali integrali tegishli integral yig'indining ma'lum ma'nodagi limiti sifatida ta'riflanadi. Bu limit tushunchasi murakkab xarakterga ega bo'lib, uni shu ta'rif bo'yicha hisoblash hatto sodda hollarda ham ancha qiyin bo'ladi.

Agar  $f(x, y)$  funksiyaning  $(D)$  sohada integrallanuvchiligi ma'lum bo'lsa, unda bilamizki, integral yig'indi  $(D)$  sohaning bo'laklash usuliga ham, har bir bo'lakda olingan  $(\xi_n, \eta_k)$  nuqtalarga ham bog'liq bo'lmay,  $\lambda_p \rightarrow 0$  da yagona  $\iint_D f(x, y) dD$  songa intiliadi. Natijada funksiyaning ikki karrali integralini topish  $(\nu)$

uchun birorta bo'laklashga nisbatan integral yig'indining limitini hisoblash yetarli bo'ladi. Bu hol  $(D)$  sohaning bo'lakshini hamda  $(\xi_n, \eta_k)$  nuqtalarni integral yig'indini va uning limitini hisoblashga qulay qilib olish imkonini beradi.

#### 17. I-misol. Ushbu

$$\iint_D xy dD$$

integral hisoblansin, bunda  $(D) = \{(x, y) \in R^2 : 0 \leq x \leq 1, 0 \leq y \leq 1-x\}$ .

◀ Ravshanki,  $f(x, y) = xy$  funksiya  $(D)$  da uzlusiz. Demak, bu funksiya  $(D)$  sohada integrallanuvchi.

$(D)$  sohani

$$(D_n) = \left\{ (x, y) \in R^2 : \frac{i}{n} \leq x \leq \frac{i+1}{n}, \frac{k}{n} \leq y \leq \frac{k+1}{n}, \frac{i}{n} + \frac{k}{n} \leq 1 \right\} \\ (i = 0, 1, 2, \dots, n-1, k = 0, 1, 2, \dots, n-1)$$

bo'laklarga ajratib, har bir  $(D_{ik})$  da  $(\xi_i, \eta_k) = \left( \frac{i}{n}, \frac{k}{n} \right)$  deb qaraymiz.

U holda

$$\sigma = \sum_{i=0}^{n-1} \sum_{k=0}^{n-1} f(\xi_i, \eta_k) D_{ik} = \sum_{i=0}^{n-1} \left[ \sum_{k=0}^{n-1} i \cdot \frac{k}{n} \cdot \frac{1}{n^2} + \frac{i}{n} \cdot \frac{n-i}{n} \cdot \frac{1}{2n^2} \right] = \\ = \frac{1}{2n^4} \sum_{i=0}^{n-1} i(n-i)^2 = \frac{1}{2n^2} \left( \frac{n^2(n-1)n}{2} - 2n \cdot \frac{n(n-1)(2n-1)}{6} + \frac{n^2(n-1)^2}{4} \right)$$

bo'ladi. Bundan esa

$$\lim_{n \rightarrow \infty} \sigma = \frac{1}{24}$$

bo'lishi kelib chiqadi. Demak,

$$\iint_D xy dD = \frac{1}{24} \quad ▶$$

Umuman, ko'p hollarda funksiyalarning karrali integrallarini ta'rifga ko'ra hisoblash qiyin bo'ladi. Shuning uchun karrali integrallarni hisoblashning amaliy jihatdan qulay bo'lgan yo'llarini topish zaruriyatni tug'ildi.

Yuqorida aytib o'tganimizdek,  $f(x, y)$  funksiyaning karrali integrali va uni hisoblash ( $D$ ) sohaga bog'liq.

Avvalo sodda holda, ( $D$ ) soha to'g'ri to'rtburchak sohadan iborat bo'lgan holda funksiyaning karrali integralini hisoblaymiz.

**6-teorema.**  $f(x, y)$  funksiya  $(D) = \{(x, y) \in R^2 : a \leq x \leq b, c \leq y \leq d\}$  sohada berilgan va integrallanuvchi bo'lsin.

Agar  $x$  ( $x \in [a, b]$ ) o'zgaruvchining har bir tayin qiymatida

$$J(x) = \int_c^d f(x, y) dy$$

integral mavjud bo'lsa, u holda ushbu

$$\int_a^b \left[ \int_c^d f(x, y) dy \right] dx$$

integral ham mavjud va

$$\iint_D f(x, y) dD = \int_a^b \left[ \int_c^d f(x, y) dy \right] dx$$

bo'ladi.

◀ ( $D$ ) sohani

$$(D_{ik}) = \{(x, y) \in R^2 : x_i \leq x \leq x_{i+1}, y_k \leq y \leq y_{k+1}\} \\ (i = 0, 1, 2, \dots, n-1, k = 0, 1, 2, \dots, m-1)\}$$

bo'laklarga ajratamiz. Bu bo'laklashni  $P_{nm}$  deb belgilaymiz. Uning diametri

$$\lambda_{P_{nm}} = \max \sqrt{\Delta x_i^2 + \Delta y_k^2} \quad (\Delta x_i = x_{i+1} - x_i, \Delta y_k = y_{k+1} - y_k).$$

Modomiki,  $f(x, y)$  funksiya ( $D$ ) sohada integrallanuvchi ekan, u shu sohada chegaralangan bo'ladi. Binobarin,  $f(x, y)$  funksiya har bir ( $D_{ik}$ ) da chegaralangan va demak, u shu sohada aniq yuqori hamda aniq quyi chegaralariga ega bo'ladi:

$$m_{ik} = \inf \{f(x, y) : (x, y) \in (D_{ik})\},$$

$$M_{ik} = \sup \{f(x, y) : (x, y) \in (D_{ik})\}, \\ (i = 0, 1, 2, \dots, n-1, k = 0, 1, 2, \dots, m-1).$$

Ravshanki,  $\forall (x, y) \in (D_{ik})$  uchun  $m_{ik} \leq f(x, y) \leq M_{ik}$  xususan,  $\xi_i \in [x_i, x_{i+1}]$  uchun ham  $m_{ik} \leq f(\xi_i, y) \leq M_{ik}$  bo'ladi. Teoremaning shartidan foydalaniq quyidagini topamiz:

$$\int_{y_k}^{y_{k+1}} m_{ik} dy \leq \int_{y_k}^{y_{k+1}} f(\xi_i, y) dy \leq \int_{y_k}^{y_{k+1}} M_{ik} dy,$$

ya'ni

$$m_{ik} \Delta y_k < \int_{y_k}^{y_{k+1}} f(\xi_i, y) dy \leq M_{ik} \Delta y_k \quad (\Delta y_k = y_{k+1} - y_k).$$

Agar keyingi tengsizliklarni  $k$  ning ( $k = 0, 1, 2, \dots, m-1$ ) qiymatlarida yozib, ularni hadlab qo'shsak, u holda

$$\sum_{k=0}^{m-1} m_{ik} \Delta y_k \leq \sum_{k=0}^{m-1} \int_{y_k}^{y_{k+1}} J(\xi_i, y) dy \leq \sum_{k=0}^{m-1} M_{ik} \Delta y_k,$$

ya'ni

$$\sum_{k=0}^{n-1} m_{ik} \Delta y_k \leq \int_c^d f(\xi_i, y) dy = J(\xi_i) \leq \sum_{k=0}^{n-1} M_{ik} \Delta y_k \quad (i = 0, 1, 2, \dots, n-1)$$

bo'ladi.

Endi keyingi tengsizliklarni  $\Delta x_i = x_{i+1} - x_i$  ga ko'paytirib, so'ng hadlab qo'shamiz. Natijada

$$\sum_{i=0}^{n-1} \left( \sum_{k=0}^{m-1} m_{ik} \Delta y_k \right) \Delta x_i \leq \sum_{i=0}^{n-1} J(\xi_i) \Delta x_i \leq \sum_{i=0}^{n-1} \left( \sum_{k=0}^{m-1} M_{ik} \Delta y_k \right) \Delta x_i$$

bo'ladi.

Ravshanki,

$$\sum_{i=0}^{n-1} \left( \sum_{k=0}^{m-1} m_{ik} \Delta y_k \right) \Delta x_i = \sum_{i=0}^{n-1} \sum_{k=0}^{m-1} m_{ik} \Delta x_i \Delta y_k = \sum_{i=0}^{n-1} \sum_{k=0}^{m-1} m_{ik} D_{ik} = S$$

$f(x, y)$  funksiya uchun Darbuning quyi yig'indisi,

$$\sum_{i=0}^{n-1} \left( \sum_{k=0}^{m-1} M_{ik} \Delta y_k \right) \Delta x_i = \sum_{i=0}^{n-1} \sum_{k=0}^{m-1} M_{ik} D_{ik} = S$$

esa Darbuning yuqori yig'indisidir. Demak,

$$S \leq \sum_{i=0}^{n-1} J(\xi_i) \Delta x_i \leq S. \quad (17.13)$$

Shartga ko'ra  $f(x, y)$  funksiya ( $D$ ) da integrallanuvchi. U holda  $\lambda_{x_m} \rightarrow 0$  da

$$S \rightarrow \iint_D f(x, y) dD, \quad S \rightarrow \iint_D f(x, y) dD$$

bo'ladi.

(17.13) munosabatda esa,

$$\sum_{i=0}^{n-1} J(\xi_i) \Delta x_i$$

yig'indi limitga ega hamda bu limit

$$\iint_D f(x, y) dD$$

ga teng bo'lishi kelib chiqadi:

$$\lim_{\lambda_{x_m} \rightarrow 0} \sum_{i=0}^{n-1} J(\xi_i) \Delta x_i = \iint_D f(x, y) dD.$$

Agar

$$\lim_{\lambda_{x_m} \rightarrow 0} \sum_{i=0}^{n-1} J(\xi_i) \Delta x_i = \int_a^b J(x) dx$$

va

$$\int_a^b J(x) dx = \int_a^b \left| \int_c^x f(x, y) dy \right| dx$$

ekanligini e'tiborga olsak, unda

$$\iint_D f(x, y) dD = \int_a^b \left[ \int_c^d f(x, y) dy \right] dx$$

bo'lishini topamiz. ▶

**7-teorema.**  $f(x, y)$  funksiya  $(D) = \{(x, y) \in R^2 : a \leq x \leq b; c \leq y \leq d\}$  sohada berilgan va integrallanuvchi bo'lisin. Agar  $y (y \in [c, d])$  o'zgaruvchining har bir tayin qiymatida

$$J(y) = \int_a^b f(x, y) dx$$

integral mavjud bo'lsa, u holda ushbu

$$\int_a^b \left[ \int_c^d f(x, y) dx \right] dy$$

integral ham mavjud va

$$\iint_D f(x, y) dD = \int_c^d \left[ \int_a^b f(x, y) dx \right] dy$$

bo'ladi.

Bu teoremaning isboti yuqoridagi teoremaning isboti kabitdir. 6-teorema va 7-teoremalardan quyidagi natijalar kelib chiqadi.

**4-natija.**  $f(x, y)$  funksiya  $(D)$  sohada berilgan va integrallanuvchi bo'lisin. Agar  $x (x \in [a, b])$  o'zgaruvchining har bir tayin qiymatida  $\int_c^d f(x, y) dy$  integral mavjud bo'lsa,  $y (y \in [c, d])$  o'zgaruvchining har bir tayin qiymatida  $\int_a^b f(x, y) dx$

integral mavjud bo'lsa, u holda ushbu

$$\int_a^b \left[ \int_c^d f(x, y) dy \right] dx, \quad \int_c^d \left[ \int_a^b f(x, y) dx \right] dy \quad (*)$$

integrallar ham mavjud va

$$\iint_D f(x, y) dD = \int_a^b \left[ \int_c^d f(x, y) dy \right] dx = \int_c^d \left[ \int_a^b f(x, y) dx \right] dy$$

bo'ladi.

**5-natija.** Agar  $f(x, y)$  funksiya  $(D)$  sohada berilgan va uzuksiz bo'lsa, u holda

$$\iint_D f(x, y) dD, \quad \int_a^b \left[ \int_c^d f(x, y) dy \right] dx, \quad \int_c^d \left[ \int_a^b f(x, y) dx \right] dy$$

integrallarning har biri mavjud va ular bir-biriga teng bo'ladi.

(\*) integrallar, tuzilishiga ko'ra, ikki argumentli funksiyadan avval bir argumenti bo'yicha (ikkinci argumentini o'zgarmas hisoblab turib), so'ng ikkinchi argumenti bo'yicha olingan integrallardir. Bunday integrallarni takroriy integrallar deh atash (takroriy limitlar singari) tabiyidir.

Shunday qilib, qaralayotgan holda karrali integrallarni hisoblash takroriy integralarni hisoblashga keltirilar ican. Takroriy integralni hisoblash esa ikkita oddiy (bir argumentli funksiyaning integralini) Riman integralini ketma-kei hisoblash demakdir.

**2-eslatma** Yuqorida keltirilgan 6-teoremani isbotlash jarayonida ko'rdikki, to'g'ri to'rtburchak ( $D$ ) soha, tomonlari mos ravishda  $\Delta x_i$ ,  $\Delta y_k$  bo'lgan to'g'ri to'rtburchak sohalar ( $D_{ik}$ ) larga ajratildi. Ravshanki, bu elementar sohaning yuzi  $D_{ik} = \Delta x_i \cdot \Delta y_k$  bo'ladi.

Avval aytganimizdek,  $\Delta x$  ni  $dx$  ga,  $\Delta y$  ni  $dy$  ga almashtirish mumkinligini hamda  $a \leq x \leq b$ ,  $c \leq y \leq d$  ekanini c'tiborga olib, bundan buyon integralni ushbu

$$\iint_D f(x, y) dD \quad (1)$$

ko'rinishda yozish o'rniiga

$$\iint_D f(x, y) dy dx \quad (\text{yoki } \iint_D f(x, y) dx dy)$$

kabi ham yozib ketaveramiz.

### 17.2-misol. Ushbu

$$\iint_D \frac{x}{(1+x^2+y^2)^{\frac{3}{2}}} dx dy$$

integral hisoblansin, bunda  $(D) = \{(x, y) \in \mathbb{R}^2 : 0 \leq x \leq 1, 0 \leq y \leq 1\}$ .

◀ Integral ostidagi

$$f(x, y) = \frac{x}{(1+x^2+y^2)^{\frac{3}{2}}}$$

funksiya ( $D$ ) sohada uzluksiz. Unda qaralayotgan ikki karrali integral ham.

$$\iint_D \frac{x}{(1+x^2+y^2)^{\frac{3}{2}}} dy dx$$

integral ham mavjud. 7-teoremaga ko'ra

$$\left| \iint_D \frac{x}{(1+x^2+y^2)^{\frac{3}{2}}} dy \right| dx$$

integral mavjud bo'ladi va

$$\iint_D \frac{x}{(1+x^2+y^2)^{\frac{3}{2}}} dy dx = \left[ \int_0^1 \left( \int_0^y \frac{x}{(1+x^2+y^2)^{\frac{3}{2}}} dy \right) dx \right]$$

bo'ladi.

Agar

$$\int_0^1 \frac{x}{(1+x^2+y^2)^{\frac{3}{2}}} dy = \frac{1}{2} \int_0^1 (1+x^2+y^2)^{\frac{1}{2}} d(1+x^2+y^2) =$$

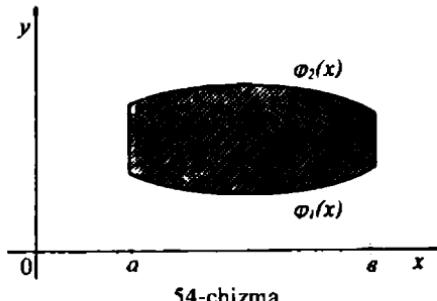

$$= \left[ \frac{1}{\sqrt{1+x^2+y^2}} \right]_{y=0}^{y=1} = \sqrt{y^2+1} - \sqrt{x^2+2}$$

bo'lishini hisobga olsak, unda

$$\begin{aligned} \iint_D \frac{x \, dx \, dy}{(y)(1+x^2+y^2)^{\frac{3}{2}}} &= \int_0^1 \left[ \frac{1}{\sqrt{y^2+1}} - \frac{1}{\sqrt{y^2+2}} \right] dy = \\ &= \left[ \ln(y + \sqrt{y^2+1}) - \ln(y + \sqrt{y^2+2}) \right]_0^1 = \ln \frac{2+\sqrt{2}}{1+\sqrt{3}} \end{aligned}$$

ekanini topamiz. Demak,  $\iint_D \frac{x \, dx \, dy}{(y)(1+x^2+y^2)^{\frac{3}{2}}} = \ln \frac{2+\sqrt{2}}{1+\sqrt{3}}$ . ▶

Endi  $(D)$  soha ushbu  $(D) = \{(x, y) \in R^2 : a \leq x \leq b; \varphi_1(x) \leq y \leq \varphi_2(x)\}$  ko'ri-nishda bo'l sin. Bunda  $\varphi_1(x)$  va  $\varphi_2(x)$   $[a, b]$  da berilgan va uzlusiz funksiyalar (54-chizma)

54-chizma

**8-teorema.**  $f(x, y)$  funksiya  $(D)$  sohada berilgan va integrallanuvchi bo'l sin. Agar  $x$  ( $x \in [a, b]$ ) o'zgaruvchining har bir tayin qiymatida

$$J(x) = \int_{\varphi_1(x)}^{\varphi_2(x)} f(x, y) dy$$

integral mavjud bo'lsa, u holda ushbu

$$\int_a^b \left[ \int_{\varphi_1(x)}^{\varphi_2(x)} f(x, y) dy \right] dx$$

integral ham mavjud va

$$\iint_D f(x, y) dD = \int_a^b \left[ \int_{\varphi_1(x)}^{\varphi_2(x)} f(x, y) dy \right] dx$$

bo'ladi.

◀  $\varphi_1(x)$  va  $\varphi_2(x)$  funksiyalar  $[a, b]$  da uzlusiz. Veyershtrass teoremasiga ko'ra bu funksiyalar  $[a, b]$  da o'zining eng katta va eng kichik qiymatlariga erishadi. Ularni

$$\min_{a \leq x \leq b} \varphi_1(x) = c, \quad \max_{a \leq x \leq b} \varphi_2(x) = d$$

deb belgilaylik.

Endi

$$(D_1) = \{(x, y) \in R^2 : a \leq x \leq b; c \leq y \leq d\}$$

sohada ushbu

$$f^*(x, y) = \begin{cases} f(x, y), & \text{agar } (x, y) \in D \\ 0, & \text{agar } (x, y) \in (D_1) \setminus (D) \end{cases} \text{ bo'lsa.}$$

funksiyani qaraylik.

Ravshanki, teorema shartlarida bu funksiya  $(D_1)$  sohada integrallanuvchi va integral xossasiga ko'ra

$$\iint_{(D_1)} f^*(x, y) dD = \iint_{(D)} f^*(x, y) dD + \iint_{(D) \setminus (D_1)} f^*(x, y) dD = \iint_{(D)} f(x, y) dD \quad (17.14)$$

bo'ladi. Shuningdek,  $x$  ( $x \in [a, b]$ ) o'zgaruvchining har bir tayin qiymatida

$$J_1(x) = \int_c^d f^*(x, y) dy$$

integral mavjud va

$$\begin{aligned} J_1(x) = \int_c^d f^*(x, y) dy &= \int_c^{\psi_1(x)} f^*(x, y) dy + \int_{\psi_1(x)}^{\psi_2(x)} f^*(x, y) dy + \\ &+ \int_{\psi_2(x)}^d f^*(x, y) dy = \int_c^{\psi_1(x)} f(x, y) dy \end{aligned} \quad (17.15)$$

bo'ladi. Unda 6-teoremaga ko'ra

$$\int_a^b \left[ \int_c^{\psi_1(x)} f(x, y) dy \right] dx$$

integral ham mavjud va

$$\iint_{(D)} f^*(x, y) dD = \int_a^b \left[ \int_c^{\psi_1(x)} f(x, y) dy \right] dx$$

bo'ladi.

(17.14) va (17.15) munosabatdan

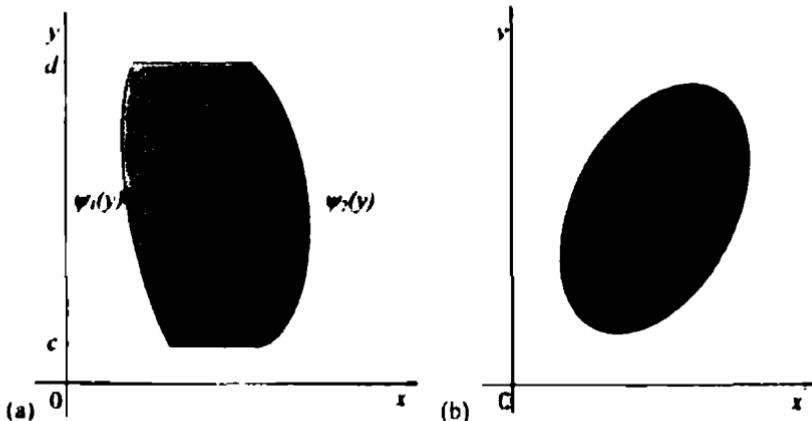

$$\iint_{(D)} f(x, y) dD = \int_a^b \left[ \int_{\psi_1(x)}^{\psi_2(x)} f(x, y) dy \right] dx$$

bo'lishi kelib chiqadi. ▶

Endi  $(D)$  soha ushbu

$$(D) = \{(x, y) \in R^2 \mid \psi_1(y) \leq x \leq \psi_2(y), c \leq y \leq d\}$$

ko'rinishda bo'lzin. Bunda  $\psi_1(x)$  va  $\psi_2(x)$   $[c, d]$  da berilgan uzlucksiz funksiyalar (55-chizma (a)).

### 55-chizma

**9-teorema.**  $f(x, y)$  funksiya ( $D$ ) sohada berilgan va integrallanuvchi bo'lsin.  
Agar  $y$  ( $y \in [c, d]$ ) o'zgaruvchining har bir tayin qiymatida

$$J(y) = \int_{v_1(y)}^{v_2(y)} f(x, y) dx$$

integral mavjud bo'lsa, u holda

$$\int_c^d \left| \int_{v_1(y)}^{v_2(y)} f(x, y) dx \right| dy$$

integral ham mavjud va

$$\iint_D f(x, y) dD = \int_c^d \left| \int_{v_1(y)}^{v_2(y)} f(x, y) dx \right| dy$$

bo'ldi.

Bu teoremaning isboti 8-teoremaning isboti kabitidir.

Faraz qilaylik, ( $D$ ) soha ( $(D) \subset R^2$ ) yuqorida qaralgan sohalarning har birining xususiyatiga ega bo'lsin (55-chizma (b)).

**6-natiya.**  $f(x, y)$  funksiya ( $D$ ) sohada berilgan va integrallanuvchi bo'lsin.  
Agar  $x$  ( $x \in [a, b]$ ) o'zgaruvchining har bir tayin qiymatida

$$\int_{\sigma_1(x)}^{\sigma_2(x)} f(x, y) dy$$

integral mavjud bo'lsa,  $y$  ( $y \in [c, d]$ ) o'zgaruvchining har bir tayin qiymatida

$$\int_{\sigma_1(y)}^{\sigma_2(y)} \left| \int_{\sigma_1(x)}^{\sigma_2(x)} f(x, y) dx \right| dx$$

integral mavjud bo'lsa, u holda

$$\int_a^b \left[ \int_{\varphi_1(x)}^{\varphi_2(x)} f(x, y) dy \right] dx, \quad \int_c^d \left[ \int_{\psi_1(y)}^{\psi_2(y)} f(x, y) dx \right] dy$$

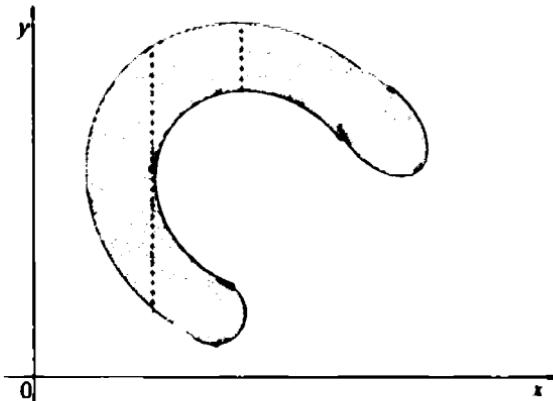

integrallar ham mavjud va

$$\iint_D f(x, y) dD = \int_a^b \left[ \int_{\varphi_1(x)}^{\varphi_2(x)} f(x, y) dy \right] dx = \int_c^d \left[ \int_{\psi_1(y)}^{\psi_2(y)} f(x, y) dx \right] dy$$

bo'ladi.

Bu natijaning isboti 8-teorema va 9-teoremadan kelib chiqadi.

Agar  $(D)$  soha (56-chizma)

### 56-chizma

tasvirlangan soha bo'lsa, u holda bu soha yuqorida o'rGANilGAN sohalar ko'rinishiga keladigan qilib bo'laklarga ajratiladi. Natijada  $(D)$  soha bo'yicha ikki karrali integral ajratilgan sohalar bo'yicha ikki karrali integrallar yig'indisiga teng bo'ladi. Shunday qilib, biz integrallash sohasi  $(D)$  ning yetarli keng sifsi uchun karrali integrallarni takroriy integralarga keltirib hisoblash mumkinligini ko'ramiz.

#### 17.3-misol. Ushbu

$$\iint_D e^{-x^2} dx dy$$

integral hisoblansin, bunda  $(D) = \{(x, y) \in R^2 : 0 \leq x \leq y, 0 \leq y \leq 1\}$ .

◀ Bu holda 7-teoremaning barcha shartlari bajariladi. O'sha teoremagaga ko'ra

$$\iint_D e^{-x^2} dx dy = \int_0^1 \left[ \int_0^y e^{-x^2} dx \right] dy$$

bo'ladi. Keyingi tenglikning o'ng tomonidagi integralarni hisoblab quyidagilarni topamiz:

$$\int e^{-x^2} dx = ye^{-y^2},$$

$$\int_0^1 ye^{-y^2} dy = \frac{1}{2} \int_a^b e^{-y^2} d(y^2) = -\frac{1}{2} e^{-y^2} \Big|_0^1 = \frac{1}{2} \left(1 - \frac{1}{e}\right)$$

Demak,

$$\iint_D e^{-y^2} dx dy = \frac{1}{2} \left(1 - \frac{1}{e}\right).$$

#### 17.4—misol Ushbu

$$\iint_D \sqrt{x+y} dx dy$$

integral hisoblansin, bunda  $(D) = \{(x,y) \in R^2 \mid 0 \leq x \leq 1, 0 \leq y \leq 1-x\}$ .

◀ Bu holda 6-teoremaning barcha shartlari bajariladi. O'sha teoremaga ko'ra

$$\iint_D \sqrt{x+y} dx dy = \int_0^1 \int_0^{1-x} \sqrt{x+y} dy \Big| dx$$

bo'ladi. Integrallarni hisoblab topamiz:

$$\int_0^1 \left[ \int_0^{1-x} \sqrt{x+y} dy \right] dx = \int_0^1 \left( \frac{2}{3} \sqrt{(x+y)^3} \right)_{y=0}^{y=1-x} dx = \frac{2}{3} \int_0^1 (1 - \sqrt{x^3}) dx = \frac{2}{5}.$$

Demak,

$$\iint_D \sqrt{x+y} dx dy = \frac{2}{5}.$$

Bu keltirilgan misollarda sodda funksiyalarning sodda soha bo'yicha ikki karrali integrallari qaraldi. Ko'p hollarda sodda funksiyalarni murakkab soha

bo'yicha. murakkab funksiyalarni sodda soha bo'yicha va ayniqsa, murakkab funksiyalarni murakkab soha bo'yicha ikki karrali integrallarini hisoblashga to'g'ri keladi. Bunday integrallarni hisoblash esa ancha qiyin ho'ladi.

#### 7-§. Ikki karrali integrallarda o'zgaruvchilarni almashtirish

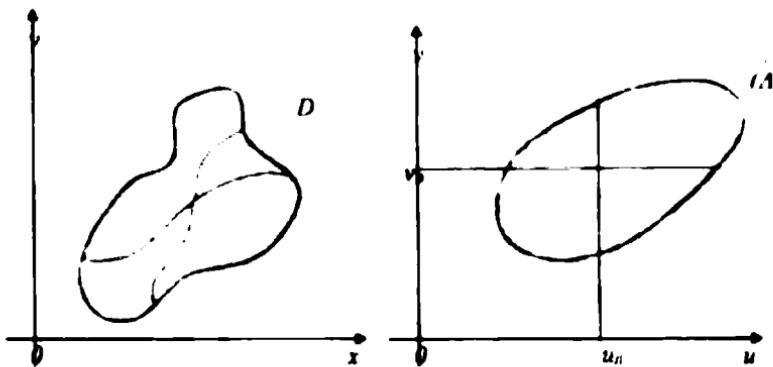

$f(x,y)$  funksiya  $(D)$  sohada  $((D) \subset R^2)$  berilgan bo'lsin. Bu funksiyaning ikki karrali

$$\iint_D f(x,y) dx dy$$

integrali mavjudligi ma'lum bo'lib, uni hisoblash talab etilsin. Ravshanki,  $f(x,y)$  funksiya hamda  $(D)$  soha murakkab bo'lsa, integralni hisoblash qiyin bo'ladi. Ko'pincha,  $x$  va  $y$  o'zgaruvchilarni, ma'lum qoidaga ko'ra boshqa o'zgaruvchilarga almashtirish natijasida integral ostidagi funksiya ham, integrallash sohasi ham soddalashib, ikki karrali integralni hisoblash osonlashadi.

Ushbu paragrafda ikki karrali integrallarda o'zgaruvchilarni almashtirish bilan shug'ullanamiz. Avvalo tekislikda sohaning yuzini egri chiziqli koordinatalar hamda sohaning yuzini egri chiziqli koordinatalarda ifodalanishini keltiramiz.

Ikkita tekislik berilgan bo'lsin (57-chizma).

57-chizma

Birinchi tekislikda to'g'ri burchakli  $Oxy$  koordinata sistemasini va chegaralangan ( $D$ ) sohani qaraylik. Bu sohaning chegarasi  $\partial D$  sodda, bo'lakli-silliq chiziqdan iborat bo'lsin. Ikkinci tekislikda esa to'g'ri burchakli  $Ouv$  koordinata sistemasini va chegaralangan ( $\Delta$ ) sohani qaraylik. Bu sohaning chegarasi  $\partial\Delta$  ham sodda, bo'lakli-silliq chiziqdan iborat bo'lsin.

$\varphi(u, v)$  va  $\psi(u, v)$  lar ( $\Delta$ ) sohada berilgan shunday funksiyalar bo'lsinki, ularidan tuzilgan  $\{\varphi(u, v), \psi(u, v)\}$  sistema ( $\Delta$ ) sohadagi  $(u, v)$  nuqtani ( $D$ ) sohadagi  $(x, y)$  nuqtaga akslantirsin:

$$\begin{aligned}\varphi : (u, v) &\rightarrow x, \\ \psi : (u, v) &\rightarrow y.\end{aligned}$$

va bu akslantirishning akslaridan iborat  $\{(x, y)\}$  to'plam ( $D$ ) ga tegishli bo'lsin.

Demak, ushbu

$$\begin{cases} x = \varphi(u, v) \\ y = \psi(u, v) \end{cases} \quad (17.16)$$

sistema ( $\Delta$ ) sohani ( $D$ ) sohada akslantiradi.

Bu akslantirish quyidagi shartlarni bajarsin:

I'. (17.16) akslantirish o'zaro bir qiymatli akslantirish, ya'ni ( $\Delta$ ) sohaning turli nuqtalarini ( $D$ ) sohaning turli nuqtalariga akslantirib, ( $D$ ) sohadagi har bir nuqta uchun ( $\Delta$ ) sohada unga mos keladigan nuqta bittagina bo'lsin.

Ravshanki, bu holda (17.16) sistema  $u$  va  $v$  larga nisbatan bir qiymatli echiladi:  $u = \varphi_1(x, y)$ ,  $v = \psi_1(x, y)$  va ushbu

$$\begin{cases} u = \varphi_1(x, y) \\ v = \psi_1(x, y) \end{cases} \quad (17.17)$$

sistema bilan akslantirish yuqoridaq akslantirishga teskari bo'lib, ( $D$ ) sohani ( $\Delta$ ) sohaga akslantiradi. Demak,

$$\begin{aligned}\varphi(\varphi_1(x, y), \psi_1(x, y)) &= x \\ \psi(\varphi_1(x, y), \psi_1(x, y)) &= y\end{aligned}\quad (17.18)$$

2°.  $\varphi(u, v)$ ,  $\psi(u, v)$  funksiyalar ( $\Delta$ ) sohada,  $\varphi_1(u, v)$ ,  $\psi_1(u, v)$  funksiyalar ( $D$ ) sohada uzlusiz va barcha xususiy hosilalarga ega bo'lib, bu xususiy hosilalar ham uzlusiz bo'lsin.

3°. (17.16) sistemadagi funksiyalarning xususiy hosilaridan tuzilgan ushbu

$$\left| \begin{array}{cc} \frac{\partial x}{\partial u} & \frac{\partial x}{\partial v} \\ \frac{\partial y}{\partial u} & \frac{\partial y}{\partial v} \\ \hline \frac{\partial u}{\partial u} & \frac{\partial v}{\partial v} \end{array} \right| \quad (17.19)$$

funksional determinantning ham ( $\Delta$ ) sohada noldan farqli (ya'ni ( $\Delta$ ) sohaning har bir nuqtasida noldan farqli) bo'lsin. Odatda (17.19) determinantni sistemaning yakobiani deyiladi va  $J(u, v)$  yoki  $\frac{D(x, y)}{D(u, v)}$  kabi betgilanadi.

Bu 2° va 3° – shartlardan, ( $\Delta$ ) bog'lamli soha bo'lganda, (17.19) yakobianning shu sohada o'z ishorasini saqlashi kelib chiqadi.

Haqiqatdan ham,  $J(u, v)$  funksiya ( $\Delta$ ) sohaning ikkita turli nuqtalarida turli ishorali qiymatlarga ko'ra, ( $\Delta$ ) da shunday  $(u_0, v_0)$  nuqta topiladi,  $J(u_0, v_0) = 0$  bo'jadi. Bu esa  $J(u, v) \neq 0$  bo'lishiga ziddir.

3-shartdan (17.17) sistemaning yakobiani, ya'ni ushbu

$$\left| \begin{array}{cc} \frac{\partial u}{\partial x} & \frac{\partial u}{\partial y} \\ \frac{\partial v}{\partial x} & \frac{\partial v}{\partial y} \\ \hline \frac{\partial x}{\partial x} & \frac{\partial y}{\partial y} \end{array} \right|$$

funksional determinantning ham ( $D$ ) sohada noldan farqli bo'lishi kelib chiqadi.

Haqiqatdan ham, (17.18) munosabatdan

$$\begin{aligned}\frac{\partial x}{\partial x} &= \frac{\partial x}{\partial u} \cdot \frac{\partial u}{\partial x} + \frac{\partial x}{\partial v} \cdot \frac{\partial v}{\partial x} = 1, \\ \frac{\partial y}{\partial x} &= \frac{\partial y}{\partial u} \cdot \frac{\partial u}{\partial x} + \frac{\partial y}{\partial v} \cdot \frac{\partial v}{\partial x} = 0, \\ \frac{\partial x}{\partial y} &= \frac{\partial x}{\partial u} \cdot \frac{\partial u}{\partial y} + \frac{\partial x}{\partial v} \cdot \frac{\partial v}{\partial y} = 0, \\ \frac{\partial y}{\partial y} &= \frac{\partial y}{\partial u} \cdot \frac{\partial u}{\partial y} + \frac{\partial y}{\partial v} \cdot \frac{\partial v}{\partial y} = 1\end{aligned}$$

bo'lishini e'tiborga olsak, u holda

$$\frac{D(x, y)}{D(u, v)} \cdot \frac{D(u, v)}{D(x, y)} = 1$$

bo'lib,

$$J_1(x, y) = \frac{D(u, v)}{D(x, y)} \neq 0$$

bo'lishini topamiz.

Demak, ( $D$ ) bog'lamli soha bo'lganda  $J_1(u, v)$  yakobiani ham ( $D$ ) sohada o'z ishorasini saqlaydi.

Yuqoridagi shartlardan yana quyidagilar kelib chiqadi.

(17.16) akslantirish ( $\Delta$ ) sohaning ichki nuqtasini ( $D$ ) sohaning ichki nuqtsiga akslantiradi. Haqiqatdan ham, oshkormas funksiyaning mavjudligi haqida teoremaga ko'r'a (17.16) sistema  $(x_0, y_0)$  nuqtaning biror atrofida  $u$  va  $v$  larni  $x$  va  $y$  o'zgaruvchilarning funksiyasi sifatida aniqlaydi:  $u = \varphi_1(x, y)$ ,  $v = \psi_1(x, y)$ . Bunda  $\varphi_1(x_0, y_0) = u_0$ ,  $\psi_1(x_0, y_0) = v_0$  bo'ladi. Demak,  $(x_0, y_0)$  ( $D$ ) sohaning ichki nuqta. Bundan (17.16) akslantirish ( $\Delta$ ) sohaning chegarasi  $\partial\Delta$  ni ( $D$ ) sohaning chegarasi  $\partial\Delta$  ga akslantirishi kelib chiqadi.

Shuningdek, (17.16) akslantirish ( $\Delta$ ) sohadagi silliq (bo'lakli -silliq) egri chiziq

$$\begin{cases} u = u(t) \\ v = v(t) \end{cases} \quad (\alpha \leq t \leq \beta)$$

ni ( $D$ ) sohadagi silliq (bo'lakli-silliq) egri chiziq

$$\begin{aligned} x &= \varphi(u(t), v(t)) \\ y &= \psi(u(t), v(t)) \end{aligned}$$

ga akslantiradi.

( $\Delta$ ) sohada  $u = u_0$  to'g'ri chiziqni olaylik. (17.16) akslantirish bu to'g'ri chiziqni ( $D$ ) sohadagi

$$\begin{aligned} x &= \varphi(u_0, v) \\ y &= \psi(u_0, v) \end{aligned} \quad (17.20)$$

egri chiziqqa akslantiradi. Xuddi shunday ( $\Delta$ ) sohadagi  $v = v_0$  to'g'ri chiziqni (17.16) akslantirish ( $D$ ) sohadagi

$$\begin{aligned} x &= \varphi(u, v_0) \\ y &= \psi(u, v_0) \end{aligned} \quad (17.21)$$

egri chiziqqa akslantiradi. Odatda, (17.20) va (17.21) egri chiziqlarni koordinata chiziqlari (17.20) ni  $v$  koordinata chizig'i, (17.21) ni esa  $u$  koordinata chizig'i) deb ataladi.

Modomiki, (17.16) akslantirish o'zaro bir qiymatli akslantirish ekan, unda ( $D$ ) sohaning har bir  $(x, y)$  nuqtasidan yagona  $v$  koordinata chizig'i ( $u$  ning tayin o'zarmas qiymatiga mos bo'lgan chiziq), yagona  $u$  koordinata chizig'i ( $v$  ning tayin o'zarmas qiymatiga mos bo'lgan chiziq) o'tadi. Demak, ( $D$ ) sohaning shu  $(x, y)$  nuqta yuqorida aytigan  $u$  va  $v$  lar bilan, ya'ni ( $\Delta$ ) sohaning  $(u, v)$  nuqta bilan to'liq aniqlanadi. Shuning uchun  $u$  va  $v$  larni ( $D$ ) soha nuqtalarining koordinatalari deb qarash mumkin. ( $D$ ) soha nuqtalarining bunday koordinatalari egri chiziqli koordinatalari deyiladi.

Masalan, ushbu

$$\begin{aligned} x &= \rho \cos \varphi \\ y &= \rho \sin \varphi \end{aligned} \quad (\rho > 0, 0 < \varphi < 2\pi)$$

sistema  $(\Delta) = \{(u, v) \in R^2 : 0 \leq \rho < +\infty, 0 \leq \varphi < 2\pi\}$  sohani  $Oxy$  tekislikka akslantiradi. Bu sistemaning yakobiani

$$J(u, v) = \begin{vmatrix} \cos \varphi & -\rho \sin \varphi \\ \sin \varphi & \rho \cos \varphi \end{vmatrix} = \rho$$

bo'ladi.

$\rho$  va  $\varphi$  lar  $(D)$  soha nuqtalarining egri chiziqli koordinatalari bo'lib, shu sohaning koordinat chiziqlari esa, markazi  $(0, 0)$  nuqtada, radiusi  $\rho$  ga teng ushbu

$$x^2 + y^2 = \rho^2$$

aylanalardan ( $v$  koordinat chiziqlari) hamda  $(0, 0)$  nuqtadan chiqqan  $\varphi - \rho_0$  ( $0 \leq \rho_0 < 2\pi$ ) nurlardan ( $v$  koordinat chiziqlari) iborat.

Faraz qilaylik, ushbu

$$x = \varphi(u, v)$$

$$y = \psi(u, v)$$

sistema  $(\Delta)$  sohani  $(D)$  sohaga akslantirsin. Bu akslantirish yuqoridagi 1<sup>0</sup>-3<sup>0</sup>-shartlarni bajarsin. U holda  $(D)$  sohaning yuzi

$$D = \iint_{(\Delta)} |J(u, v)| dudv = \iint_{(D)} \frac{|J(x, y)|}{|D(u, v)|} dxdy \quad (17.22)$$

bo'ladi.

Bu formulaning isboti keyingi bobda keltiriladi (qarang, 18-boh, 3-§).

$f(x, y)$  funksiya  $(D)$  sohada  $((D) \subset R^2)$  berilgan va shu sohada uzliksiz bo'lsin.  $(D)$  esa sodda, bo'lakli-silliq chiziq bilan chegaralangan soha bo'lsin. Ravshanki,  $f(x, y)$  funksiya  $(D)$  sohada integrallanuvchi bo'ladi.

Aytaylik, ushbu

$$x = \varphi(u, v)$$

$$y = \psi(u, v)$$

sistema  $(\Delta)$  sohani  $(D)$  sohaga akslantirsin va bu akslagtirish yuqoridagi 1<sup>0</sup>-3<sup>0</sup>-shartlarni bajarsin.

Har bir bo'lувчи chizig'i bo'lakli-silliq bo'lgan  $(\Delta)$  sohaning  $P_\Delta$  bo'laklanishi shini olaylik. (17.16) akslantirish natijasida  $(D)$  sohaning  $P_D$  bo'laklanishi hosil bo'ladi. Bu bo'laklanishga nisbatan  $f(x, y)$  funksiya integral yig'indisi

$$\sigma = \sum_{k=1}^n f(\xi_k, \eta_k) D_k$$

ni tuzamiz. Ravshanki,

$$\lim_{P_D \rightarrow \infty} \sigma = \lim_{\lambda_{P_D} \rightarrow 0} \sum_{k=1}^n f(\xi_k, \eta_k) D_k = \iint_{(D)} f(x, y) dxdy.$$

Yuqorida keltirilgan (17.22) formulaga ko'ra

$$D_k = \iint_{(\Delta_k)} |J(u, v)| dudv$$

bo'ladi. O'rta qiymat haqidagi teoremdan foydalanih quyidagini topamiz:

$$D_k = \left| J(u_k^+, v_k^+) \cdot \Delta_k \quad ((u_k^+, v_k^+) \in (\Delta_k)) \right|$$

bunda  $\Delta_k = (\Delta_k)$  ning yuzi. Natijada  $\sigma$  yig'indi ushbu

$$\sigma = \sum_{k=1}^n f(\xi_k, \eta_k) |J(u_k^+, v_k^+)| \Delta_k$$

ko'rinishga keladi.

$(\xi_k, \eta_k)$  nuqtaning  $(D_k)$  sohadagi ixtiyoriy nuqta ekanligidan foydalanih, uni

$$\begin{aligned}\varphi(u_k^+, v_k^+) &= \xi_k \\ \psi(u_k^+, v_k^+) &= \eta_k\end{aligned}$$

deb olish mumkin. U holda

$$\sigma = \sum_{k=1}^n f(\varphi(u_k^+, v_k^+), \psi(u_k^+, v_k^+)) |J(u_k^+, v_k^+)| \Delta_k$$

bo'ladi.

Ravshanki,

$$f(\varphi(u, v), \psi(u, v)) |J(u, v)|$$

funksiya  $(\Delta)$  sohada uzuksiz. Demak, u shu sohada integrallanuvchi. U holda

$$\begin{aligned}\lim_{\Delta_{p_k} \rightarrow 0} \sigma &= \lim_{\Delta_{p_k} \rightarrow 0} \sum_{k=1}^n f(\varphi(u_k^+, v_k^+), \psi(u_k^+, v_k^+)) |J(u_k^+, v_k^+)| \Delta_k = \\ &= \iint_{(\Delta)} f(\varphi(u, v), \psi(u, v)) |J(u, v)| du dv\end{aligned}$$

bo'ladi.

$\lambda_{p_k} \rightarrow 0$  da  $\lambda_{p_k} \rightarrow 0$  bo'lishini e'tiborga olib, topamiz:

$$\iint_{(D)} f(x, y) dx dy = \iint_{(\Delta)} f(\varphi(u, v), \psi(u, v)) |J(u, v)| du dv. \quad (17.23)$$

Bu ikki karrali integralda o'zgaruvchilarni almashtirish formulasidir.

U berilgan  $(D)$  soha bo'yicha integralni hisoblashni  $(\Delta)$  soha bo'yicha integralni hisoblashga keltiradi. Agarda (17.23) da o'ng tomondag'i integralni hisoblash engil bo'lsa, hajarilgan o'zgaruvchilarni almashtirish o'zini oqlaydi.

**17.5-misol** Ushbu

$$\iint_{(D)} \sqrt{\frac{1-x^2-y^2}{1+x^2+y^2}} dx dy$$

integral hisoblansin, bunda

$$(D) = \{(x, y) \in R^2 : x^2 + y^2 < 1; y > 0\}$$

markazi  $(0, 0)$  nuqtada, radiusi 1 ga teng bo'lgan yuqori tekislikdagi yarim doira.

► Berilgan integralda o'zgaruvchilarni quyidagicha almashtiramiz:

$$x = \rho \cos \varphi,$$

$$y = \rho \sin \varphi$$

Bu almashtirish ushbu

$$(\Delta) = \{(\rho, \varphi) \in R^2 : 0 < \varphi < \pi, 0 < \rho < 1\}$$

to'g'ri to'rtburchakni ( $D$ ) sohaga aksantiradi va u  $1^0$ - $3^0$ -chartlarni qanoatlantiradi.

Unda (17.23) formulaga ko'ra

$$\iint_D \sqrt{1-x^2-y^2} dx dy = \iint_{\Delta} \sqrt{\frac{1-\rho^2}{1+\rho^2}} J(\rho, \varphi) d\rho d\varphi$$

bo'ladi. Bunda yakobian  $J(\rho, \varphi) = \rho$  bo'ladi. Bu tenglikning o'ng tomondag'i integralni hisoblab topamiz:

$$\iint_{\Delta} \sqrt{\frac{1-\rho^2}{1+\rho^2}} J(\rho, \varphi) d\rho d\varphi = \int_0^{\pi} \left( \int_0^{\infty} \sqrt{\frac{1-\rho^2}{1+\rho^2}} \rho d\rho \right) = \pi \int_0^{\infty} \sqrt{\frac{1-\rho^2}{1+\rho^2}} \rho d\rho = \frac{\pi}{4} (\pi - 2).$$

Demak,

$$\iint_D \sqrt{1-x^2-y^2} dx dy = \frac{\pi}{4} (\pi - 2). \blacksquare$$

#### 6-§. Ikki karral integralni taqribiy hisoblash

$f(x, y)$  funksiya ( $D$ ) sohada  $(D) \in R^2$  berilgan va shu sohada integrallanuvchi, ya'ni

$$\iint_D f(x, y) dx dy \quad (17.23)$$

integral mavjud bo'lsin. Ma'lum ko'rinishga ega bo'lgan ( $D$ ) sohalar uchun bunday integralni hisoblash 6-§ da keltirildi. Ravshanki,  $f(x, y)$  funksiya murakkab bo'lsa, shuningdek, integrallash sohasi murakkab ko'rinishga ega bo'lsa, unda (17.23) integralni hisoblash ancha qiyin bo'ladi va ko'p hollarda bunday integralni taqribiy hisoblashga to'g'ri keladi.

Ushbu paragrafsda (17.23) integralni taqribiy hisoblashni amalga oshiradigan sodda formulalardan birini keltiramiz.

Aytaylik,  $f(x, y)$  funksiya  $(D) = \{(x, y) \in R^2 : a \leq x \leq b; c \leq y \leq d\}$  to'g'ri to'rtburchakda berilgan va uzuksiz bo'lsin. Unda 6-§ da keltirilgan formulaga ko'ra

$$\iint_D f(x, y) dx dy = \int_a^b \left[ \int_c^d f(x, y) dy \right] dx \quad (17.24)$$

bo'ladi.

Endi

$$\int_c^d f(x, y) dy, \quad (x \in [a, b])$$

integralga 1-qism, 9-bob, 2-§ dagi (9.52) formulani -to'g'ri to'rtburchaklar formulasini taqbiq etib, ushbu

$$\int_c^d f(x, y) dy = \frac{d-c}{n} \sum_{k=0}^{n-1} f(x, y_{k+1}) \quad (x \in [a, b]) \quad (17.25)$$

taqribiy formulani hosil qilamiz. So'ng

$$\int_c^d f(x, y) dy$$

integralga yana o'sha (9.53) formulani qo'llab, quyidagi

$$\int_a^b f(x, y_{k+\frac{1}{2}}) dx \approx \frac{b-a}{n} \sum_{i=0}^{n-1} f\left(x_{i+\frac{1}{2}}, y_{k+\frac{1}{2}}\right) \quad (17.26)$$

taqrifiy formulaga kelamiz.

Natijada (17.24), (17.25) va (17.26) munosabatlardan

$$\iint_D f(x, y) dxdy \approx \frac{(b-a)(d-c)}{nm} \sum_{i=0}^{n-1} \sum_{k=0}^{m-1} f\left(x_{i+\frac{1}{2}}, y_{k+\frac{1}{2}}\right) \quad (17.27)$$

bo'lishi kelib chiqadi.

Bu ikki karrali integralni taqrifiy hisoblash formulasi, «to'g'ri to'rburchaklar» formulasida, ikki karrali integral maxsus tuzilgan yig'indi bilan almashtiriladi. Bu yig'indi esa quyidagicha tuziladi:

$(D) = \{(x, y) \in R^2 : a \leq x \leq b, c \leq y \leq d\}$  to'g'ri to'rburchak  $nm$  ta teng  
 $(D_{ik}) = \{(x, y) \in R^2 : x_i \leq x \leq x_{i+1}, y_k \leq y \leq y_{k+1}\}$  ( $i = 0, 1, 2, \dots, m-1$ ,  $k = 0, 1, 2, \dots, n-1$ ) to'g'ri to'rburchaklarga ajratiladi. Bunda

$$x_i = a + i \frac{b-a}{m}, \quad y_k = c + k \frac{d-c}{n}.$$

Har bir  $(D_{ik})$  ning markazi bo'lgan  $(x_{i+\frac{1}{2}}, y_{k+\frac{1}{2}})$  ( $i = 0, 1, 2, \dots, m-1$ ,  $k = 0, 1, 2, \dots, n-1$ ) nuqtada  $f(x, y)$  funksiyaning qiymati  $f(x_{i+\frac{1}{2}}, y_{k+\frac{1}{2}})$  hisoblanib, uni shu  $(D_{ik})$  ning yuziga ko'paytiriladi. So'ngra ular barcha  $i$  va  $k$  lar ( $i = 0, 1, 2, \dots, m-1$ ,  $k = 0, 1, 2, \dots, n-1$ ) bo'yicha yig'iladi.

Odatda, har bir taqrifiy formulaning xatoligi topiladi yoki baholanadi. Keltirilgan taqrifiy formulaning xatoligini ham o'rghanish mumkin.

### 17.6-misol. Ushbu

$$\iint_D \frac{1}{(x+y+1)^2} dxdy$$

integral taqrifiy hisoblansin, bunda

$$(D) = \{(x, y) \in R^2 : 0 \leq x \leq 1, 0 \leq y \leq 1\}.$$

◀  $(D)$  ni ushbu to'rtta bo'lakka bo'lamiz:

$$(D_{00}) = \left\{ (x, y) \in R^2 : 0 \leq x \leq \frac{1}{2}, 0 \leq y \leq \frac{1}{2} \right\},$$

$$(D_{01}) = \left\{ (x, y) \in R^2 : 0 \leq x \leq \frac{1}{2}, \frac{1}{2} < y \leq 1 \right\},$$

$$(D_{10}) = \left\{ (x, y) \in R^2 : \frac{1}{2} \leq x \leq 1, 0 \leq y \leq \frac{1}{2} \right\},$$

$$(D_{11}) = \left\{ (x, y) \in R^2 : \frac{1}{2} \leq x \leq 1, \frac{1}{2} < y \leq 1 \right\}.$$

Bu bo'laklarning markazlari

$$\left(\frac{1}{4}, \frac{1}{4}\right), \left(\frac{1}{4}, \frac{3}{4}\right), \left(\frac{3}{4}, \frac{1}{4}\right), \left(\frac{3}{4}, \frac{3}{4}\right)$$

nuqtalarda

$$f(x, y) = \frac{1}{(1+x+y)^2}$$

funksiyaning qiymatlarini hisoblab, (17.23) formulaga ko'ra

$$\iint_D \frac{1}{(1+x+y)^2} dx dy \approx 0.2761$$

bo'lishini topamiz. Bu integralning aniq qiymati esa

$$\iint_D \frac{1}{(1+x+y)^2} dx dy = \int_0^1 \left[ \int_{-x}^x \frac{dx}{(1+x+y)^2} \right] dy = \ln \frac{4}{3} = 0.287682 \dots$$

bo'ladi. ▶

### 9-8. Ikki karrali integralarning ba'zi bir tatbiqlari

Ushhu paragrafdada ikki karrali integralarning ba'zi bir tatbiqlarini keltiramiz.

*I<sup>th</sup>. Jismning hajmini hisoblash.* R' fazoda ( $V$ ) jism yuqoridan  $z = f(x, y)$  sirt bilan, (bunda  $f(x, y)$  funksiya ( $D$ ) da uzlucksiz) yon tomonlaridan yasovchilar  $Oz$  o'qiga parallel bo'lgan silindrik sirt hamda pastdan  $Oxy$  tekislikdagi ( $D$ ) soha bilan chegaralangan jism bo'lisin.

( $D$ ) yopiq sohaning  $P$  bo'laklashni olamiz.  $f(x, y)$  funksiya ( $D$ ) da uzlucksiz bo'lganligi sahali, bu funksiya  $P$  bo'laklash har bir ( $D_k$ ) bo'lagida ham uzlucksiz bo'lib, unda  $\inf\{f(x, y) : (x, y) \in (D_k)\} = m_k$ ,  $\sup\{f(x, y) : (x, y) \in (D_k)\} = M_k$  ( $k = 1, 2, 3, \dots, n$ ) larga ega bo'ladi.

Quyidagi

$$V_A = \sum_{k=1}^n m_k D_k,$$

$$V_B = \sum_{k=1}^n M_k D_k$$

yig'indilarni tuzamiz. Bu yig'indilarning birinchisi ( $V$ ) jism ichiga joylashgan ko'pyoqning hajmini, ikkinchisi esa ( $V$ ) jismni o'z ichiga olgan ko'pyoqning hajmini ifodalaydi.

Ravshanki, bu ko'pyoqlar, demak, ularning hajmlari ham  $f(x, y)$  funksiyaga hamda ( $D$ ) sohaning bo'laklashga hog'liq bo'ladi:

$$V_A = V_A^P(f), \quad V_B = V_B^P(f).$$

( $D$ ) sohaning turli bo'laklari olansa, ularga nisbatan ( $V$ ) jismning ichiga joylashgan hamda ( $V$ ) jismni o'z ichiga olgan turli ko'pyoqlar yasaladi. Natijada bu ko'pyoqlar xajmlaridan iborat quyidagi

$$\{V_A^P(f)\}, \{V_B^P(f)\}$$

to'plamlar hosil bo'ladi. Bunda  $\{V_A^P(f)\}$  to'plam yuqoridan  $\{V_B^P(f)\}$  to'plam esa quyidan chegaralangan bo'ladi. Demak, bu to'plamlarning aniq chegaralari

$$\sup\{V_A^P(f)\}, \inf\{V_B^P(f)\}$$

mavjud. Shartga ko'ra  $f(x, y)$  funksiya ( $D$ ) yopiq sohada uzliksiz. U holda Kantor teoremasining natijasiga asosan,  $\forall \varepsilon > 0$  son olinganda ham,  $\frac{\varepsilon}{D}$  songa ko'ra shunday  $\delta > 0$  son topiladiki, ( $D$ ) sohaning diametri  $\lambda_p < \delta$  bo'lgan har qanday bo'laklashi  $P$  uchun har bir ( $D_k$ ) da funksiyaning tebranishi

$$M_k - m_k < \frac{\varepsilon}{D}$$

bo'ladi. Unda

$$\begin{aligned} |\inf\{V_B^P(f)\} - \sup\{V_A^P(f)\}| &\leq V_B^P(f) - V_A^P(f) = \sum_{k=1}^n M_k D_k - \sum_{k=1}^n m_k D_k = \\ &= \sum_{k=1}^n (M_k - m_k) D_k < \frac{\varepsilon}{D} \sum_{k=1}^n D_k = \frac{\varepsilon}{D} D = \varepsilon. \end{aligned}$$

Demak, ( $D$ ) sohaning diametri  $\lambda_p < \delta$  bo'lgan har qanday bo'laklanishi olinganda ham bu bo'laklanishga mos ( $V$ ) jismning ichiga joylashgan hamda bu ( $V$ ) ni o'z ichiga olgan ko'pyoq hajmlari uchun har doim

$$0 \leq \inf\{V_B^P(f)\} - \sup\{V_A^P(f)\} < \varepsilon$$

tengsizlik o'rinni bo'ladi. Bundan esa

$$\inf\{V_B^P(f)\} = \sup\{V_A^P(f)\} \quad (17.28)$$

tenglik kelib chiqadi. Bu tenglik ( $V$ ) jism hajmga ega bo'lishini bildiradi.

Endi yuqorida o'rganilgan  $V_A^P(f)$ ,  $V_B^P(f)$  yig'indilarni Darbu yig'indilari bilan taqqoslab.  $V_A^P(f)$  ham  $V_B^P(f)$  yig'indilar  $f(x, y)$  funksiyaning ( $D$ ) sohada mos ravishda Darbu quyisi hamda yuqori yig'indilari ekanini topamiz. Shuning uchun ushbu

$$\sup\{V_A^P(f)\}, \inf\{V_B^P(f)\}$$

miqdorlar  $f(x, y)$  funksiyaning quyisi hamda yuqori ikki karrali integrallari bo'ladi, ya'ni

$$\sup\{V_A^P(f)\} = \iint_D f(x, y) dD, \quad \inf\{V_B^P(f)\} = \iint_D f(x, y) dD$$

Yuqoridagi (17.28) munosabatga ko'ra

$$\iint_D f(x, y) dD = \iint_D f(x, y) dD$$

tenglik o'rinni ekanini ko'rindi. Demak,

$$\iint_D f(x, y) dD = \iint_D f(x, y) dD = \iint_D f(x, y) dD.$$

Shunday qilib, bir tomonidan, qaralayotgan ( $V$ ) jism hajmga ega ekani ikkinchi tomondan, uning hajmi  $f(x, y)$  funksiyaning ( $D$ ) soha bo'yicha ikki karrali integraliga teng ekani isbot etildi. Demak, ( $V$ ) jismning hajmi uchun ushbu

$$V = \iint_D f(x, y) dD \quad (17.29)$$

formula o'rini.

### 17.7-misol. Ushbu

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} \leq 1$$

ellipsoidning hajmi topitsin.

◀ Bu ellipsoid  $z=0$  tekislikka nisbatan simmetrikdir. Yuqori qismini ( $z \geq 0$ ) o'rab turgan sirt

$$z = c \sqrt{1 - \frac{x^2}{a^2} - \frac{y^2}{b^2}}$$

bo'ladi.

Yuqoridagi (17.29) formulaga ko'ra ellipsoidning hajmi ( $V$ ):

$$V = 2c \iint_D \sqrt{1 - \frac{x^2}{a^2} - \frac{y^2}{b^2}} dx dy$$

bo'ladi. bunda

$$(D) = \left\{ (x, y) \in R^2 : \frac{x^2}{a^2} + \frac{y^2}{b^2} \leq 1 \right\}.$$

Integralda

$$\begin{aligned} x &= a\rho \cos \varphi \\ y &= b\rho \sin \varphi \end{aligned} \quad (17.30)$$

almashtirishni bajaramiz. Bu sistemaning yakobiani

$$J(\rho, \varphi) = \begin{vmatrix} a \cos \varphi & b \sin \varphi \\ -a \rho \sin \varphi & b \rho \cos \varphi \end{vmatrix} = ab \rho$$

bo'ladi. (17.30) sistema  $(\Delta) = \{(\rho, \varphi) \in R^2 : 0 \leq \rho \leq 1, 0 \leq \varphi \leq 2\pi\}$  sohani ( $D$ ) sohaga akstantiradi. (17.23) formulaga ko'ra

$$\iint_D \sqrt{1 - \frac{x^2}{a^2} - \frac{y^2}{b^2}} dx dy = \iint_{\Delta} \sqrt{1 - \rho^2} ab \rho d\rho d\varphi$$

bo'ladi. Demak,

$$\begin{aligned} V &= 2ab \iint_{\Delta} \sqrt{1 - \rho^2} ab \rho d\rho d\varphi = 2ab \iint_0^{2\pi} \int_0^1 \rho d\varphi \sqrt{1 - \rho^2} ab \rho d\rho = \\ &= 4\pi ab \int_0^1 \sqrt{1 - \rho^2} \rho d\rho = \frac{4\pi}{3} ab c. \end{aligned}$$

Shunday qilib, ellipsoidning hajmi

$$V = \frac{4}{3} \pi abc$$

bo'ladi. ▶

**2º. Yassi shaklning yuzi.** Ushbu bobning 1-§ ida ( $D$ ) sohaning yuzi quyidagi

$$D = \iint_D dD = \iint_D dx dy$$

integralga teng bo'lishini ko'rdik. Demak, ikki karrali integral yordamida yassi shaklning yuzini hisoblash mumkin ekan.

Xususan, soha

$$(D) = \{(x, y) \in R^2 : a < x \leq b, 0 \leq y \leq f(x)\}$$

egri chiziqli trapesiyadan iborat bo'lsa ( $f(x)$  funksiya  $[a, b]$  da uzliksiz) u holda

$$D = \iint_D dx dy = \int_a^b \left[ \int_0^{f(x)} dy \right] dx = \int_a^b f(x) dx$$

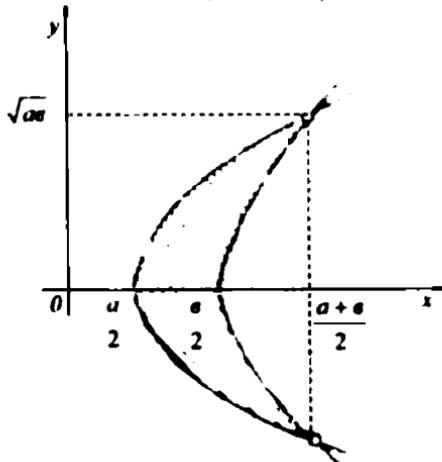

bo'lib, 1-qism, 10-bob, 2-§ da topilgan formulaga kelamiz.

**17.8-misol.** Ushbu

$$x = \frac{y^2 + a^2}{2a}, \quad x = \frac{y^2 + b^2}{2b}, \quad (0 < a < b)$$

chiziqlar bilan chegaralangan shaklning yuzi topilsin.

◀ Bu chiziqlar parabolalardan iborat (58-chizma).

58-chizma

Quyidagi

$$\begin{cases} x - \frac{y^2 + a^2}{2a} = 0 \\ x - \frac{y^2 + b^2}{2b} = 0 \end{cases}$$

sistemani echib, parabolalarning kesishgan nuqtalarini

$$\left( \frac{a+b}{2}, \sqrt{ab} \right), \quad \left( \frac{a+b}{2}, -\sqrt{ab} \right)$$

ekanini topamiz. Qaralayotgan shakl  $Ox$  o'qiga simmetrik bo'lismeni e'tiborga olsak, u holda ( $D$ ) ning yuzi

$$D = 2 \iint_{(D_1)} dx dy$$

bo'ldi, bunda

$$(D_1) = \{(x, y) \in R^2 : \frac{y^2 + a^2}{2a} \leq x < \frac{y^2 + a^2}{2a}, 0 \leq y \leq \sqrt{aa}\}.$$

Integralni hisoblab, quyidagini topamiz:

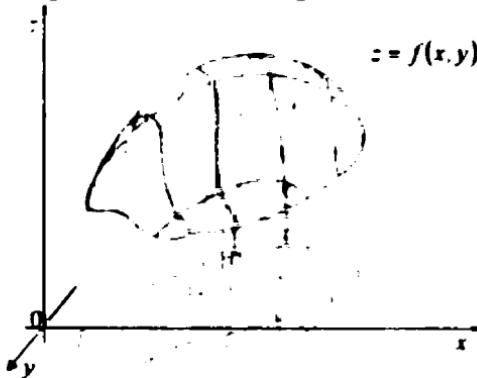

$$\iint_{(D_1)} dx dy = \int_0^{\sqrt{aa}} \left[ \int_{\frac{y^2 + a^2}{2a}}^{\frac{y^2 + a^2}{2a}} dx \right] dy = \int_0^{\sqrt{aa}} \left( \frac{y^2 + a^2}{2a} - \frac{y^2 + a^2}{2a} \right) dy = \frac{1}{3}(a - a)\sqrt{aa}.$$

Demak,

$$D = \iint_D dx dy = \frac{2}{3}(a - a)\sqrt{aa}. \blacktriangleright$$

**3°. Sirtning yuzi va uning karrali integral orqali ifodalishishi.** Ikki karrali integral yordamida sirt yuzini hisoblash mumkin. Avvalo sirtning yuzi tushunchasini keltiramiz.

Faraz qilaylik,  $z = f(x, y)$  funksiya ( $D$ ) sohada berilgan va uzliksiz bo'lsin. Bu funksiyaning grafiki 59-chizmada tasvirlangan sirtdan iborat bo'lsin.

59-chizma

( $D$ ) sohaning  $P$  bo'laklashni olaylik. Uning bo'laklari ( $D_1$ ), ( $D_2$ ), ..., ( $D_n$ ) bo'lsin. Bu bo'laklashning bo'luvchi chiziqlarini yo'naltiruvchilar sifatida qarab, ular orqali yasovchilari  $Oz$  o'qiga parallel bo'lgan silindrik sirtlar o'tkazamiz. Ravshanki, bu silindrik sirtlar ( $S$ ) sirtni ( $S_1$ ), ( $S_2$ ), ..., ( $S_n$ ) bo'lakkarga ajratadi. Har bir ( $D_k$ ) ( $k = 1, 2, \dots, n$ ) da ixtiyoriy ( $\xi_k, \eta_k$ ) nuqta olib, ( $S$ ) sirda unga mos nuqta ( $\xi_k, \eta_k, z_k$ ) ( $z_k = f(\xi_k, \eta_k)$ ) ni topamiz. So'ng ( $S$ ) sirtga shu ( $\xi_k, \eta_k, z_k$ ) nuqtada urinma tekislik o'tkazamiz. Bu urinma tekislik bilan yuqorida aytilgan silindrik sirtning kesishishidan hosil bo'lgan urinma tekislik qismini ( $T_k$ ) bilan, uning yuzini esa  $T_k$  bilan belgilaymiz.

Geometriyadan ma'lumki,  $(D_k)$  soha  $(T_k)$  ning ortogonal proeksiyasi bo'lib,

$$D_k = T_k |\cos \gamma_k| \quad (17.31)$$

bo'ladi, bunda  $\gamma_k - (S)$  sirtga  $(\xi_n, \eta_n, z_k)$  ( $z_k = f(\xi_n, \eta_n)$ ) nuqtada o'tkazilgan urinma tekislik normalining  $Oz$  o'qi bilan tashkil etgan burchak.

Ravshanki,  $\lambda_p \rightarrow 0$  da  $(S_k)$  ( $k = 1, 2, \dots, n$ ) ning diametri ham nolga intildi.

Agar  $\lambda_p \rightarrow 0$  da

$$\sum_{k=1}^n T_k$$

yig'indi chekli limitga ega bo'lsa, bu limit  $(S)$  sirtning yuzi deb ataladi. Demak,  $(S)$  sirtning yuzi

$$S = \lim_{\lambda_p \rightarrow 0} \sum_{k=1}^n T_k \quad (17.32)$$

bo'ladi.

Yuqorida qaralayotgan  $z = f(x, y)$  funksiya  $(D)$  sohada  $f'_x(x, y)$ ,  $f'_y(x, y)$  xususiy hosilalarga ega bo'lib, bu xususiy hosilalar  $(D)$  sohada uzuksiz bo'lsin. U holda

$$\cos \gamma_k = \frac{1}{\sqrt{1 + f'^2_x(\xi_k, \eta_k) + f'^2_y(\xi_k, \eta_k)}}$$

bo'ladi.

(17.31) munosabatdan

$$T_k = -\frac{1}{\cos \gamma_k} D_k$$

bo'lishini topamiz. Demak,

$$\sum_{k=1}^n T_k = \sum_{k=1}^n \frac{1}{\cos \gamma_k} D_k = \sum_{k=1}^n \sqrt{1 + f'^2_x(\xi_k, \eta_k) + f'^2_y(\xi_k, \eta_k)} D_k \quad (17.33)$$

Tenglikning o'ng tomonidagi yig'indi

$$\sqrt{1 + f'^2_x(x, y) + f'^2_y(x, y)}$$

funksiyaning integral yig'indisidir (qarang 1-§). Bu funksiya  $(D)$  sohada uzuksiz. demak, integrallanuvchi. Shuning uchun

$$\lim_{\lambda_p \rightarrow 0} \sum_{k=1}^n \sqrt{1 + f'^2_x(\xi_k, \eta_k) + f'^2_y(\xi_k, \eta_k)} D_k = \iint_D \sqrt{1 + f'^2_x(x, y) + f'^2_y(x, y)} dD$$

bo'ladi.

Shunday qilib, (17.32) va (17.33) munosabatlardan

$$S = \iint_D \sqrt{1 + f'^2_x(x, y) + f'^2_y(x, y)} dD \quad (17.34)$$

bo'lishi kelib chiqadi.

**17.9-misol.** Asosning radiusi  $r$  balandligi  $h$  bo'lgan doiraviy konusning yon sirti topilsin.

◀ Bunday konus sirtning tenglamasi

$$z = \frac{h}{r} \sqrt{x^2 + y^2}$$

bo'ladi. Yuqoridagi (17.34) formulaga ko'ra

$$S = \iint_D \sqrt{1 + z_x'^2 + z_y'^2} dx dy$$

bo'ladi, bunda

$$(D) = \{(x, y) \in R^2 : x^2 + y^2 \leq r^2\}.$$

Endi

$$z_x' = \frac{h}{r} \frac{x}{\sqrt{x^2 + y^2}}, \quad z_y' = \frac{h}{r} \frac{y}{\sqrt{x^2 + y^2}}$$

va

$$\sqrt{1 + z_x'^2 + z_y'^2} = \sqrt{1 + \frac{h^2}{r^2} \frac{x^2}{x^2 + y^2} + \frac{h^2}{r^2} \frac{y^2}{x^2 + y^2}} = \sqrt{1 + \frac{h^2}{r^2}} .$$

ekanini e'tiborga olib, quyidagini topamiz:

$$S = \iint_D \sqrt{1 + \frac{h^2}{r^2}} dx dy = \sqrt{1 + \frac{h^2}{r^2}} \iint_D dx dy = \sqrt{1 + \frac{h^2}{r^2}} \pi r^2 = \pi r \sqrt{r^2 + h^2} .$$

### 10-8. Uch karrali integral

Yuqorida Riman integrali tushunchasining ikki o'zgaruvchili funksiya uchun qanday kiritilishini ko'rdik va uni batafsil o'rgandik. Xuddi shunga o'xshash bu tushuncha uch o'zgaruvchili funksiya uchun ham kiritildi. Uni o'rganishda Riman integrali hamda ikki karrali integralda yuritilgan barcha mulohazalar (integrallash sohasining bo'laklanishini olish, bo'laklarda ictiyoriy nuqta tanlab olib, integral yig'indi tuzish, tegishlichcha limitga o'tish va hokazo) qaytariladi. Shuni e'tiborga olib, quyida uch karrali integral haqida faktlarni keltirish bilan chegaralanamiz.

*Iº. Uch karrali integral ta'rifி*  $f(x, y, z)$  funksiya  $R^3$  fazodagi chegaralangan ( $V$ ) sohada berilgan bo'lisin. (Bu erda va kelgusida hamma vaqt funksiyaning berilish sohasi ( $V$ ) ni hajmga ega bo'lgan deb qaraymiz). ( $V$ ) sohaning  $P$  bo'laklashini va bu bo'laklashning har bir ( $V_k$ ) ( $k = 1, 2, \dots, n$ ) bo'lagida ictiyoriy  $(\xi_k, \eta_k, \zeta_k)$  nuqtani olaylik. So'ngra quyidagi

$$\sigma = \sum_{k=1}^n f(\xi_k, \eta_k, \zeta_k) \cdot V_k$$

yig'indini tuzamiz, bunda  $V_k - (V_k)$  ning hajmi.

Bu yig'indi  $f(x, y, z)$  funksiyaning integral yig'indisi yoki Riman yig'indisi deb ataladi.

Endi ( $V$ ) sohaning shunday

$$P_1, P_2, \dots, P_m, \dots$$

bo'laklanishlarini qaraymizki, ularning diametridan tashkil topgan

$$\lambda_{P_1}, \lambda_{P_2}, \dots, \lambda_{P_m}, \dots$$

ketma-ketlik nolga intilsin:  $\lambda_p \rightarrow 0$ . Bunday  $P_m$  ( $m = 1, 2, \dots$ ) bo'laklanishlarga nishatan  $f(x, y, z)$  funksiyaning integral yig'indisini tuzamiz:

$$\sigma_m = \sum_{k=1}^m f(\xi_k, \eta_k, \zeta_k) V_k$$

Natijada quyidagi

$$\sigma_1, \sigma_2, \dots, \sigma_m, \dots$$

ketma-ketlik hosil bo'ladi. Bu ketma-ketlikning har bir hadi  $(\xi_k, \eta_k, \zeta_k)$  nuqtalarga bog'liq.

**9-ta'rif.** Agar  $(V)$  ning har qanday bo'laklanishlar ketma-ketligi  $\{P_m\}$  olinganda ham, unga mos integral yig'indi qiymatlaridan iborat  $\{\sigma_m\}$  ketma-ketlik  $(\xi_k, \eta_k, \zeta_k)$  nuqtalarni tanlab olinishiga bog'liq bo'ligan holda hamma vaql bitta  $J$  songa intilsa, bu  $J$  son  $\sigma$  yig'indining limiti deh ataladi va u

$$\lim_{\lambda_p \rightarrow 0} \sigma = \lim_{\lambda_p \rightarrow 0} \sum_{k=1}^m f(\xi_k, \eta_k, \zeta_k) V_k = J$$

kabi belgilanadi.

**10-ta'rif.** Agar  $\lambda_p \rightarrow 0$  da  $f(x, y, z)$  funksiyaning integral yig'indisi  $\sigma$  chekli limitga ega bo'lsa,  $f(x, y, z)$  funksiya  $(V)$  da integrallanuvchi (Riman ma'nosida integrallanuvchi) funksiya deyiladi. Bu  $\sigma$  yig'indining chekli limiti  $J$  esa  $f(x, y, z)$  funksiyaning  $(V)$  bo'yicha uch karrali integrali (Riman integrali) deyiladi va u

$$\iiint_V f(x, y, z) dV$$

kabi belgilanadi. Demak,

$$\iiint_V f(x, y, z) dV = \lim_{\lambda_p \rightarrow 0} \sigma = \lim_{\lambda_p \rightarrow 0} \sum_{k=1}^m f(\xi_k, \eta_k, \zeta_k) V_k.$$

$f(x, y, z)$  funksiya  $(V)$  da  $((V) \subset R^3)$  berilgan bo'lib, u shu sohada chegaralangan bo'lsin:

$$m \leq f(x, y, z) \leq M \quad (\forall (x, y, z) \in (V)).$$

$(V)$  sohaning bo'laklanishlar to'plami  $\{P\}$  ning har bir bo'laklanishiga nisbatan  $f(x, y, z)$  funksiyaning Darbu yig'indilari

$$s_p(f) = \sum_{k=1}^m m_k V_k, \quad S_p(f) = \sum_{k=1}^m M_k V_k$$

ni tuzib, ushbu

$$\{s_p(f)\}, \quad \{S_p(f)\}$$

to'plamlarni qaraylik. Ravshanki, bu to'plamlar chegaralangan bo'ladi.

**11-ta'rif.**  $\{s_p(f)\}$  to'plamning aniq yuqori chegarasi  $f(x, y, z)$  funksiyaning quy'i uch karrali integrali deb ataladi va u

$$J = \iiint_V f(x, y, z) dV$$

kabi belgilanadi.

$\{S_p(f)\}$  to'plamning aniq quyi chegarasi  $f(x,y,z)$  funksiyaning yuqori uch karrali integrali deb ataladi va u

$$\bar{J} = \iiint_V f(x,y,z) dV$$

kabi belgilanadi.

**12-ta'rif.** Agar  $f(x,y,z)$  funksiyaning quyi hamda yuqori uch karrali integrallari bir-biriga teng bo'lса,  $f(x,y,z)$  funksiya ( $V$ ) da integrallanuvchi deb ataladi va ularning umumiy qiymati

$$J = \iiint_V f(x,y,z) dV = \iiint_F f(x,y,z) dV$$

$f(x,y,z)$  funksiyaning uch karrali integrali (Riman integrali) deyiladi.

$$\iiint_V f(x,y,z) dV = \iiint_F f(x,y,z) dV = \iiint_V f(x,y,z) dV.$$

**2°. Uch karrali integralning mavjudligi.**  $f(x,y,z)$  funksiya ( $V$ ) $\subset R^3$  sohada berilgan bo'lsin.

**10-teorema.**  $f(x,y,z)$  funksiya ( $V$ ) sohada integrallanuvchi bo'lishi uchun  $\forall \varepsilon > 0$  olinganda ham shunday  $\delta > 0$  topilib, ( $V$ ) sohaning diametri  $\lambda_p < \delta$  bo'lgan har qanday  $P$  bo'laklashiga nishbatan Darbu yig'indilari

$$S_p(f) - s_p(f) < \varepsilon$$

tengsizlikni qanoatlantirishi zarur va yetarli.

**3°. Integrallanuvchi funksiyalar sinfi.** Uch karrali integralning mavjudligi haqidagi teoremadan foydalaniб, ma'lum sind funksiyalarining integrallanuvchi bo'lishi ko'rsatildi.

**11-teorema.** Agar  $f(x,y,z)$  funksiya chegaralangan yopiq ( $V$ ) $\subset R^3$  sohada berilgan va uzlusiz bo'lса, u shu sohada integrallanuvchi bo'ladi.

**12-teorema.** Agar  $f(x,y,z)$  funksiya ( $V$ ) sohada chegaralangan va bu sohaning chekli sondagi nol hajmi sirlarida uzilishiga ega bo'lib, qolgan barcha nuqtalarda uzlusiz bo'lса, funksiya ( $V$ ) da integrallanuvchi bo'ladi.

**4°. Uch karrali integralning xossalari.** Uch karrali integrallar ham ushbu bobning 5-§ idа keltirilgan ikki karrali integralning xossalari kabi xossalarga ega.

**I).**  $f(x,y,z)$  funksiya ( $V$ ) sohada berilgan bo'lib, ( $V$ ) soha nol hajmi ( $S$ ) sirt bilan ( $V_1$ ) va ( $V_2$ ) sohalarga ajratilgan bo'lsin. Agar  $f(x,y,z)$  funksiya ( $V$ ) sohada integrallanuvchi bo'lса, funksiya ( $V_1$ ) va ( $V_2$ ) sohalarda ham integrallanuvchi bo'ladi, va aksincha, ya'ni  $f(x,y,z)$  funksiya ( $V_1$ ) va ( $V_2$ ) sohalarning har birida integrallanuvchi bo'lса, funksiya ( $V$ ) sohada ham integrallanuvchi bo'ladi. Bunda

$$\iiint_V f(x,y,z) dV = \iiint_{V_1} f(x,y,z) dV + \iiint_{V_2} f(x,y,z) dV$$

bo'ladi.

2). Agar  $f(x, y, z)$  funksiya ( $V$ ) da integrallanuvchi bo'lsa, u holda  $c \cdot f(x, y, z)$  ( $c = const$ ) funksiya ham shu sohada integrallanuvchi va ushbu

$$\iiint_V c f(x, y, z) dV = c \iiint_V f(x, y, z) dV$$

formula o'rini bo'ladi.

3). Agar  $f(x, y, z)$  va  $g(x, y, z)$  funksiyalar ( $V$ ) da integrallanuvchi bo'lsa, u holda  $f(x, y, z) \pm g(x, y, z)$  funksiya ham shu sohada integrallanuvchi va ushbu

$$\iiint_V [f(x, y, z) \pm g(x, y, z)] dV = \iiint_V f(x, y, z) dV \pm \iiint_V g(x, y, z) dV$$

formula o'rini bo'ladi.

4). Agar  $f(x, y, z)$  funksiya ( $V$ ) da integrallanuvchi bo'lib,  $\forall (x, y, z) \in V$  uchun  $f(x, y, z) > 0$  bo'lsa, u holda

$$\iiint_V f(x, y, z) dV > 0$$

bo'ladi.

5). Agar  $f(x, y, z)$  funksiya ( $V$ ) da integrallanuvchi bo'lsa, u holda  $|f(x, y, z)|$  funksiya ham shu sohada integrallanuvchi va

$$\left| \iiint_V f(x, y, z) dV \right| \leq \iiint_V |f(x, y, z)| dV$$

bo'ladi.

6). Agar  $f(x, y, z)$  funksiya ( $V$ ) da integrallanuvchi bo'lsa, u holda shunday o'zgarmas  $\mu$  ( $m \leq \mu \leq M$ ) son mavjudki,

$$\iiint_V f(x, y, z) dV = \mu \cdot V$$

bo'ladi, bunda  $V - (V)$  sohaning hajmi.

7). Agar  $f(x, y, z)$  funksiya yopiq ( $V$ ) sohada uzlusiz bo'lsa, u holda bu sohada shunday  $(a, b, c) \in V$  nuqta topiladiki,

$$\iiint_V f(x, y, z) dV = f(a, b, c) \cdot V$$

bo'ladi.

**5<sup>th</sup>. Uch karrali integrallarni hisoblash.**  $f(x, y, z)$  funksiya

$(V) = \{(x, y, z) \in R^3 : a \leq x \leq b, c \leq y \leq d, e \leq z \leq f\}$  sohada (parallelepipedda) berilgan va uzlusiz bo'lsin. U holda

$$\iiint_V f(x, y, z) dV = \int_a^b \int_c^d \int_e^f f(x, y, z) dz dy dx$$

bo'ladi.

Endi  $(V) \subset R^3$  soha – pastdan  $z = \psi_1(x, y)$  yuqoridan  $z = \psi_2(x, y)$  sirtlar bilan, yon tomonidan esa  $Oz$  o'qiga parallel silindrik sirt bilan chegaralangan soha bo'lsin. Bu sohaning  $Oxy$  tekislikdagi proeksiyasi esa ( $D$ ) bo'lsin.

Agar  $f(x, y, z)$  funksiya shunday ( $V$ ) sohada uzlusiz bo'lib,  $z = \psi_1(x, y)$ ,  $z = \psi_2(x, y)$  funksiyalar ( $D$ ) da uzlusiz bo'lsa, u holda

$$\iiint_V f(x, y, z) dV = \iint_D \left( \int_{\psi_1(x, y)}^{\psi_2(x, y)} f(x, y, z) dz \right) dx dy$$

bo'ladi. Agar yuqoridagi holda  $(D) = \{(x, y) \in R^2 \mid a \leq x \leq b, \varphi_1(x) \leq y \leq \varphi_2(x)\}$  bo'lib,  $\varphi_1(x)$  va  $\varphi_2(x)$  funksiyalar [ $a, b$ ] da uzlusiz bo'lsa, u holda

$$\iiint_V f(x, y, z) dV = \int_a^b \left[ \int_{\varphi_1(x)}^{\varphi_2(x)} \int_{\psi_1(x, y)}^{\psi_2(x, y)} f(x, y, z) dz \right] dy dx$$

bo'ladi.

**6°. Uch karrali integrallarda o'zgaruvchilarni almashtirish.** Uch karrali integrallarda o'zgaruvchilarni almashtirish ushbu bobning 7-§ da keltirilgan ikki karrali integrallarda o'zgaruvchilarni almashtirish kabidir. Shuni hisobga olib, quyida uch karrali integrallarda o'zgaruvchilarni almashtirish formulasini keltirish bilan kifoyalanamiz.

$f(x, y, z)$  funksiya  $(V) \subset R^3$  sohada berilgan va uzlusiz bo'lsin. ( $V$ ) soha esa silliq yoki bo'lakli-silliq sirtlar bilan chegaralangan bo'lsin.

Ushbu

$$x = \varphi(u, v, w),$$

$$y = \psi(u, v, w),$$

$$z = \zeta(u, v, w)$$

sistema ( $\Lambda$ )  $((\Delta) \in R^3)$  sohani ( $V$ ) sohaga aksantirsin va bu aksantirish 7-§ da keltirilgan 1°-3°-shartlarni bajarsin. U holda

$$\iiint_V f(x, y, z) dV = \iiint_{(\Delta)} f(\varphi(u, v, w), \psi(u, v, w), \zeta(u, v, w)) |J| du dv dw$$

bo'ladi. Bunda

$$J = \begin{vmatrix} \frac{\partial x}{\partial u} & \frac{\partial x}{\partial v} & \frac{\partial x}{\partial w} \\ \frac{\partial y}{\partial u} & \frac{\partial y}{\partial v} & \frac{\partial y}{\partial w} \\ \frac{\partial z}{\partial u} & \frac{\partial z}{\partial v} & \frac{\partial z}{\partial w} \end{vmatrix}$$

**7°. Uch karrali integralning ba'zi bir tatbiqlari.** Uch karrali integral yordamida  $R^3$  fazodagi jismning hajmini, jismning massasini, inersiya momentlarini topish mumkin.

### Mashqlar

**17.10. Ikki karrali integral ta'riflarining ekvivalentligi isbotlansin.**

**17.11. Ushbu**

a)  $\int_{-1}^1 dx \int_{-2}^2 f(x, y) dy$

$$b) \int_0^{2\pi} dx \int_0^{\infty} f(x, y) dy$$

integrallarda integral tartibi o'zgartirilsin.

17.12. Quyidagi

$$-\frac{\pi}{2} < \iint_D (x^2 - y^2) dx dy < 4\pi$$

tengsizliklar isbotlansin. bunda  $(D) - x^2 + y^2 - 2x = 0$  aylana bilan chegaralangan soha.

17.13. Agar  $f(x)$  funksiya  $[a, b]$  da uzluksiz bo'lsa.

$$\left[ \int_a^b f(x) dx \right]^2 \leq (b-a) \int_a^b f^2(x) dx$$

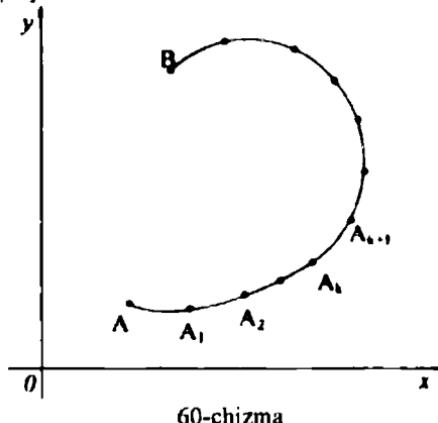

bo'lishi isbotlansin.

### Egri chiziqli integrallar

Yuqoridagi bobda Riman integrali tushunchasini ikki o'zgaruvchili funksiya uchun qanday kiritilishini ko'rdik va uni o'rgandik. Shuni ham aytish kerakki, ko'p o'zgaruvchili funksiyalar uchun integral tushunchasi turlicha kiritilishi mumkin. Biz quyida keltirgan egri chiziqli integrallar ham konkret amaliy masalalardan paydo bo'lgandir.

#### I-§. Birinchi tur egri chiziqli integrallar

*1<sup>o</sup>. Birinchi tur egri chiziqli integral ta'risi.* Tekislikda biror sodda  $\overline{AB}$  ( $A = (a_1, a_2) \in R^2, B = (b_1, b_2) \in R^2$ ) egri chiziqni (yoyni) olaylik (60-chizma). Bu egri chiziqda ikki yo'nalishdan birini musbat yo'nalish, ikkinchisini manfiy yo'nalish deb qabul qilaylik.

60-chizma

$AB$  egri chiziqni  $A$  dan  $B$  ga qarab  $A_0 = A$ ,  $A_1, \dots, A_n = B$ ,  $(A_k - (x_k, y_k)) \in \overline{AB}$ ,  $k = 0, 1, 2, \dots, n$ ,  $A_0 = (x_0, y_0) = (a_1, a_2)$ ,  $A_n = (x_n, y_n) = (b_1, b_2)$ ) nuqtalar yordamida  $n$  ta bo'lakka bo'lamic. Bu  $A_0, A_1, \dots, A_n$  nuqtalar sistemasi  $AB$  yoyining bo'laklash deb ataladi va u

$$P = \{A_0, A_1, \dots, A_n\}$$

kabi belgilanadi.  $A_k A_{k+1}$  yoy (bo'laklash yoylari) uzunliklari  $\Delta s_k$  ( $k = 0, 1, 2, \dots, n$ ) ning eng kattasi  $P$  bo'laklash diametri deyiladi va u  $\lambda_P$  bilan belgilanadi:

$$\lambda_P = \max \{\Delta s_k\}.$$

Ravshanki,  $AB$  egri chiziqni turli usullar bilan istalgan sonda bo'laklashlarini tuzish mumkin.

$AB$  egri chiziqda  $f(x, y)$  funksiya berilgan bo'lsin. Bu egri chiziqning

$$P = \{A_0, A_1, \dots, A_n\}$$

bo'laklanishi va uning har bir  $\bar{A}_k A_{k+1}$  yoyida ixtiyoriy  $Q_k = (\xi_k, \eta_k)$  ( $Q_k = (\xi_k, \eta_k) \in A_k A_{k+1}, k = 0, 1, \dots, n-1$ ) nuqtani olamiz. Berilgan funksiyaning  $Q_k = (\xi_k, \eta_k)$  nuqtadagi  $f(\xi_k, \eta_k)$  qiymatini  $A_k A_{k+1}$  ning  $\Delta s_k$  uzunligiga ko'paytirib quyidagi yig'indini tuzamiz:

$$\sigma = \sum_{k=0}^{n-1} f(\xi_k, \eta_k) \Delta s_k. \quad (18.1)$$

Endi  $AB$  egri chiziqning shunday

$$P_0, P_1, \dots, P_m, \dots \quad (18.2)$$

bo'laklashlari ketma-ketligini qaraymizki, ularning mos diametrlaridan tashkil topgan  $\lambda_{P_0}, \lambda_{P_1}, \dots, \lambda_{P_m}, \dots$  ketma-ketlik nolga intilsin:  $\lambda_{P_m} \rightarrow 0$ . Bunday bo'laklash-larga nisbatan (18.1) kabi yig'indilarni tuzib, ushbu

$$\sigma_0, \sigma_1, \dots, \sigma_m, \dots$$

ketma-ketlikni hosil qilamiz. Ravshanki, bu ketma-ketlikning har bir hadi  $Q_k = (\xi_k, \eta_k)$  nuqtalarga bog'liq.

**1-ta'rif.** Agar  $AB$  egri chiziqning har qanday (18.2) ko'rinishdagi bo'laklashlari ketma-ketligi  $\{P_n\}$  olinganda ham, unga mos yig'indilardan iborat  $\{\sigma_n\}$  ketma-ketlik  $(\xi_k, \eta_k)$  nuqtalarning tanlab olinishiga bog'liq bo'limgan holda hamma vaqt bitta  $J$  songa intilsa, bu son  $\sigma$  yig'indining limiti deb ataladi va

$$\lim_{\lambda_p \rightarrow 0} \sigma = \lim_{\lambda_p \rightarrow 0} \sum_{k=0}^{n-1} f(\xi_k, \eta_k) \Delta s_k = J \quad (18.3)$$

kabi belgilanadi.

**2-ta'rif.** Agar  $\forall \varepsilon > 0$  son olinganda ham shunday  $\delta > 0$  topilsaki,  $AB$  egri chiziqning diametri  $\lambda_p < \delta$  bo'igan har qanday  $P$  bo'laklash uchun tuzilgan  $\sigma$  yig'indi ixtiyoriy  $(\xi_k, \eta_k) \in A_k A_{k+1}$  nuqtalarda

$$|\sigma - J| < \varepsilon$$

tengsizlikni bajarsa,  $J$  son  $\sigma$  yig'indining  $\lambda_p \rightarrow 0$  dagi limiti deb ataladi va (18.3) kabi belgilanadi.

(18.1) yig'indi limitining bu ta'riflari ekvivalent ta'riflardir.

**3-ta'rif.** Agar  $\lambda_p \rightarrow 0$  da  $\sigma$  yig'indi chekli limitga ega bo'lsa,  $f(x, y)$  funksiya  $AB$  egri chiziq bo'yicha integrallanuvchi deyiladi. Bu limit  $f(x, y)$  funksiyaning egri chiziq bo'yicha birinchi tur egri chiziqli integrali deb ataladi va u

$$\int\limits_{AB} f(x, y) dS$$

kabi belgilanadi.

Shunday qilib, kiritilgan egri chiziqli integral tushunchasining o'ziga xosligi qaratayotgan ikki argumentli funksiyaning berilish sohasi tekistikda biror  $AB$  egri chiziq ekanligidir. Qolgan boshqa mulohazalar (bo'laklashlarining olinishi, bo'laklardan ixtiyoriy nuqta tanlab integral yig'indi tuzish, tegishlicha limitga o'tish) yuqorida kiritilgan integral tushunchalari singaridir.

**2º. Uzluksiz funksiya birinchi tur egri chiziqli integrali.** Yuqorida keltirilgan 3-ta'rifdan ko'rindaniki, birinchi tur egri chiziqli integral  $AB$  egri chiziqqa hamda unda berilgan  $f(x, y)$  funksiyaga bog'liq bo'ladi.

Faraż qilaylik,  $AB$  egri chiziq ushbu

$$\begin{cases} x = x(s) \\ y = y(s) \end{cases} \quad (0 \leq s \leq S) \quad (18.4)$$

sistema bilan berilgan bo'lisin. Bunda  $s - AQ$  yoyining uzunligi ( $Q = (x, y) \in AB$ )  $S$  esa  $AB$  ning uzunligi.  $f(x, y)$  funksiya shu  $AB$  egri chiziqda berilgan bo'lisin. Modomiki,  $x = x(s)$ ,  $y = y(s)$  ( $0 \leq s \leq S$ ) ekan, unda  $f(x, y) = f(x(s), y(s))$  bo'lib, natijada ushbu

$$f(x(s), y(s)) = F(s) \quad (0 \leq s \leq S)$$

murakkab funksiyaga ega bo'lamiz.

$AB$  egri chiziqning  $P = \{A_0, A_1, \dots, A_n\}$  bo'laklashini va har bir  $A_k A_{k+1}$  da ixtiyorli  $Q_k = (\xi_k, \eta_k)$  nuqtani olaylik. Har bir  $A_k$  nuqtaga mos keladigan  $AA_k$  ning uzunligi  $s_k$ , har bir  $Q_k$  nuqtaga mos keladigan  $AQ_k$  ning uzunligi  $s_k^*$  deylik. Ravshanki,  $A_k A_{k+1}$  ning uzunligi  $s_{k+1} - s_k = \Delta s_k$  bo'ladi.

Natijada  $P$  bo'laklashiga nisbatan tuzilgan

$$\sigma = \sum_{k=0}^{n-1} f(\xi_k, \eta_k) \Delta s_k$$

yig'indi ushbu

$$\sum_{k=0}^{n-1} f(\xi_k, \eta_k) \Delta s_k = \sum_{k=0}^{n-1} f(x(s_k^*), y(s_k^*)) \Delta s_k = \sum_{k=0}^{n-1} F(s_k^*) \Delta s_k$$

ko'rinishga keladi. Demak,

$$\sigma = \sum_{k=0}^{n-1} F(s_k^*) \Delta s_k. \quad (18.5)$$

Bu yig'indini  $[0, S]$  oraliqdagi  $F(s)$  funksiyaning integral yig'indisi (Riman yig'indisi) ekanligini payqash qiyin emas (qaralsin, 1-qism, 9-bob, 1-§).

Agar  $f(x, y)$  funksiya  $AB$  egri chiziqda uzluksiz bo'lsa, u holda  $F(s)$  funksiya  $[0, S]$  da uzluksiz bo'ladi. Demak, bu holda  $F(s)$  funksiya  $[0, S]$  da integrallanuvchi:

$$\lim_{\lambda_p \rightarrow 0} \sum_{k=0}^{n-1} F(s_k^*) \Delta s_k = \int_0^S F(s) ds. \quad (18.6)$$

Shunday qilib, (18.5), (18.6) munosabatlardan  $\lambda_p \rightarrow 0$  da  $\sigma$  yig'indining limiti mavjud va

$$\lim_{\lambda_p \rightarrow 0} \sigma = \int_0^S F(s) ds$$

ekanligini topamiz. Natijada quyidagi teoremgaga kelamiz.

**I-teorema.** Agar  $f(x,y)$  funksiya  $AB$  egri chiziqda uzlusiz bo'lsa, u holda bu funksiyaning  $AB$  egri chiziq bo'yicha birinchi tur egri chiziqli integrali mavjud va

$$\int\limits_{AB} f(x,y)ds = \int\limits_0^x f(x(s),y(s))ds$$

bo'ladi.

Bu teorema, bir tomonidan uzlusiz funksiya birinchi tur egri chiziqli integralining mavjudligini aniqlab bersa, ikkinchi tomonidan bu integralning aniq integralga (Riman integraliga) kelishini ko'rsatadi.

**I-eslatma.** Ushbu

$$\sigma = \sum_{k=0}^{n-1} f(\xi_k, \eta_k) \Delta s_k$$

yig'indidagi  $\Delta s_k$  har doim musbat bo'lib,  $AB$  egri chiziqning yo'nalishiga bog'liq emas. Demak.

$$\int\limits_{AB} f(x,y)ds = \int\limits_{BA} f(x,y)ds$$

**3<sup>o</sup>. Birinchi tur egri chiziqli integrallarning xossalari.** Yuqorida ko'rdikki, uzlusiz funksiyalarning birinchi tur egri chiziqli integrallari Riman integrallariga keladi. Binobarin, egri chiziqli integrallar ham Riman integrallari xossalari kabi xossalarga ega bo'ladi. Shuni e'tiborga olib, egri chiziqli integrallarning asosiy xossalarni sanab o'tish bilan kifoyalanamiz.

(18.4) sistema bilan aniqlangan  $AB$  egri chiziqda  $f(x,y)$  funksiya uzlusiz bo'lsin

1). Agar  $AB = AC + CB$  bo'lsa, u holda

$$\int\limits_{AB} f(x,y)ds = \int\limits_{AC} f(x,y)ds + \int\limits_{CB} f(x,y)ds$$

bo'ladi.

2). Ushbu

$$\int\limits_{AB} cf(x,y)ds = c \int\limits_{AB} f(x,y)ds \quad (c = const)$$

tenglik o'rinni.

$AB$  egri chiziqda  $f(x,y)$  funksiya va  $g(x,y)$  funksiyalar uzlusiz bo'lsin.

3). Quyidagi

$$\int\limits_{AB} [f(x,y) \pm g(x,y)]ds = \int\limits_{AB} f(x,y)ds \pm \int\limits_{AB} g(x,y)ds$$

formula o'rinni bo'ladi.

4). Agar  $\forall (x,y) \in AB$  da  $f(x,y) > 0$  bo'lsa, u holda

$$\int\limits_{AB} f(x,y)ds \geq 0$$

bo'ladi.

5).  $|f(x,y)|$  funksiya shu  $AB$  da integrallanuvchi va

$$\left| \int_{AB} f(x, y) ds \right| \leq \int_{AB} |f(x, y)| ds$$

bo'ladi.

6). Shunday  $(c_1, c_2) \in AB$  nuqta topiladiki,

$$\int_{AB} f(x, y) ds = f(c_1, c_2) S$$

bo'ladi, bunda  $S = AB$  ning uzunligi.

Bu xossa o'rta qiymat haqidagi teorema deb ataladi.

4'. **Birinchi tur egri chiziqli integrallarni hisoblash.** Birinchi tur egri chiziqli integrallar, asosan Riman integrallariga keltirilib hisoblanadi.

$AB$  egri chiziq ushbu

$$\begin{cases} x = \varphi(t) \\ y = \psi(t) \end{cases} \quad (\alpha \leq t \leq \beta) \quad (18.7)$$

sistema bilan (parametrik formada) berilgan bo'lsin. Bunda  $\varphi(t)$ ,  $\psi(t)$  funksiyalar  $[\alpha, \beta]$  da  $\varphi'(t)$ ,  $\psi'(t)$  hosilalarga ega va bu hosilalar shu oraliqda uzuksiz hamda  $(\varphi(\alpha), \psi(\alpha)) = A$  va  $(\varphi(\beta), \psi(\beta)) = B$  bo'lsin.

Ravshanki. (18.7) sistema  $[\alpha, \beta]$  oraliqni  $\bar{AB}$  egri chiziqqa akslantiradi. Bunda  $[\gamma, \delta] \subset [\alpha, \beta]$  ning  $AB$  chiziqdagi  $A_\gamma B_\delta$  aksning uzunligi

$$\int_{\gamma}^{\delta} \sqrt{\varphi'^2(t) + \psi'^2(t)} dt$$

bo'ladi. (qaralsin. I-qism, 10-boh, 1-§).

**2-teorema.** Agar  $f(x, y)$  funksiya  $\bar{AB}$  da uzuksiz bo'lsa, u holda

$$\int_{AB} f(x, y) ds = \int_{\alpha}^{\beta} f(\varphi(t), \psi(t)) \sqrt{\varphi'^2(t) + \psi'^2(t)} dt$$

bo'ladi.

◀  $[\alpha, \beta]$  oraliqning

$$P = \{t_0, t_1, \dots, t_n\}, \quad (\alpha = t_0 < t_1 < \dots < t_n = \beta)$$

bo'laklashini olaylik. Bu bo'laklashning bo'luvchi nuqtalari  $t_k$  ( $k = 0, 1, 2, \dots, n$ ) ning  $AB$  dagi mos akslarini  $A_k$  ( $k = 0, 1, 2, \dots, n$ ) deylik. Ravshanki. bu  $A_k$  ( $k = 0, 1, 2, \dots, n$ ) nuqtalar  $AB$  egri chiziqning

$$\{A_0, A_1, \dots, A_n\}$$

bo'laklashini hosil qiladi. Bunda  $A_k = (\varphi(t_k), \psi(t_k))$  ( $k = 0, 1, 2, \dots, n$ ) va  $A_k A_{k+1}$  ning uzunligi

$$\Delta s_k = \int_{t_k}^{t_{k+1}} \sqrt{\varphi'^2(t) + \psi'^2(t)} dt$$

bo'ladi. O'rta qiymat haqidagi teoremdan foydalaniib quyidagini topamiz:

$$\Delta s_k = \sqrt{\varphi'^2(t_k) + \psi'^2(t_k)} (t_{k+1} - t_k) = \sqrt{\varphi'^2(t_k) + \psi'^2(t_k)} \cdot \Delta t_k$$

bunda  $t_k < r_k < t_{k+1}$ .

Endi  $\varphi(r_k) = \xi_k$ ,  $\psi(r_k) = \eta_k$  deb olamiz. Ravshanki,  $(\xi_k, \eta_k) \in A_k A_{k+1}$  ( $k = 0, 1, 2, \dots, n-1$ ) bo'ladi.  $AB$  egri chiziqning yuqorida aytilgan  $\{A_1, A_2, \dots, A_n\}$

bo'laklashni va har bir  $A_k A_{k+1}$  bo'lakchasiда  $(\xi_k, \eta_k)$  nuqtani olib,

$$\sigma = \sum_{k=0}^{n-1} f(\xi_k, \eta_k) \Delta s_k$$

yig'indini tuzamiz. Uni quyidagicha ham yozish mumkin:

$$\sigma = \sum_{k=0}^{n-1} f(\xi_k, \eta_k) \Delta s_k = \sum_{k=0}^{n-1} f(\varphi(r_k), \psi(r_k)) \sqrt{\varphi'^2(r_k) + \psi'^2(r_k)} \Delta t_k. \quad (18.8)$$

Bu tenglikning o'ng tomonidagi yig'indi  $f(\varphi(t), \psi(t)) \sqrt{\varphi'^2(t) + \psi'^2(t)}$  funksiyaning  $[\alpha, \beta]$  oraliqdagi Riman yig'indisidir.

Shartga ko'ra  $f(x, y)$  va  $\varphi'(t), \psi'(t)$  funksiyalar uzlusiz. Demak, murakkab funksiyaning uzlusizligi haqidagi teoremlaga ko'ra  $f(\varphi(t), \psi(t))$  va, demak,  $f(\varphi(t), \psi(t)) \sqrt{\varphi'^2(t) + \psi'^2(t)}$  funksiya  $[\alpha, \beta]$  oraliqda uzlusiz. Demak, bu funksiya  $[\alpha, \beta]$  da integrallanuvchi bo'ladi. Ya'ni

$$\lim_{\max\{\Delta t_k\} \rightarrow 0} \sum_{k=0}^{n-1} f(\varphi(r_k), \psi(r_k)) \sqrt{\varphi'^2(r_k) + \psi'^2(r_k)} \Delta t_k = \int f(\varphi(t), \psi(t)) \sqrt{\varphi'^2(t) + \psi'^2(t)} dt.$$

Modomiki,  $x = \varphi(t)$ ,  $y = \psi(t)$  funksiyalar  $[\alpha, \beta]$  da uzlusiz ekan, unda  $\max\{\Delta t_k\} \rightarrow 0$  da  $\Delta x_k \rightarrow 0$ ,  $\Delta y_k \rightarrow 0$  va, demak,  $\Delta s_k \rightarrow 0$ . Bundan esa  $\lambda_r \rightarrow 0$  bo'lishi kelib chiqadi. (18.8) munosabatdan foydalanib

$$\lim_{\lambda_r \rightarrow 0} \sigma = \int f(\varphi(t), \psi(t)) \sqrt{\varphi'^2(t) + \psi'^2(t)} dt$$

bo'lishini topamiz. Bu esa

$$\int f(x, y) dS = \int f(\varphi(t), \psi(t)) \sqrt{\varphi'^2(t) + \psi'^2(t)} dt$$

ekanini bildiradi. ▶

Bu teoremdan quyidagi natijalar kelib chiqadi.

**1-natija.**  $AB$  egri chiziq ushbu

$$y = y(x) \quad (a \leq x \leq b, \quad y(a) = A, \quad y(b) = B)$$

tenglama bilan aniqlangan bo'lub,  $y(x)$  funksiya  $[a, b]$  da hosilaga ega va u uzlusiz bo'lsin. Agar  $f(x, y)$  funksiya shu  $AB$  da uzlusiz bo'lsa, u holda

$$\int f(x, y) dS = \int f(x, y(x)) \sqrt{1 + y'^2(x)} dx$$

bo'ladi.

**2-natija.**  $AB$  egri chiziq ushbu

$$\rho = \rho(\theta) \quad (\theta_0 \leq \theta \leq \theta_1)$$

tenglama bilan (qutb koordinata sistemasida) berilgan bo'lib,  $\rho(\theta)$  funksiya  $[\theta_0, \theta_1]$  da hosilaga ega va u uzluksiz bo'lsin. Agar  $f(x, y)$  funksiya shu  $AB$  da uzluksiz bo'lsa, u holda

$$\int_{AB} f(x, y) dS = \int_{\theta_0}^{\theta_1} f(\rho \cos \theta, \rho \sin \theta) \sqrt{\rho^2(\theta) + \rho'^2(\theta)} d\theta$$

bo'ladi.

Bu natijalarni isbotlashni o'quvchiga havola etamiz.

### 18.1-misol Ushbu

$$\int_{AB} \sqrt{x^2 + y^2} ds$$

egri chiziqli integral hisoblansin, bunda  $AB$  -markazi koordinata boshida, radiusi  $r > 0$  ga teng bo'lgan aylananing yuqori yarim tekislikdag'i qismi.

◀ Ravshanki, bu egri chiziq quyidagi

$$\begin{cases} x = r \cos t \\ y = r \sin t \end{cases}, \quad (0 \leq t \leq \pi)$$

sistema bilan aniqlanadi.  $AB$  da  $f(x, y) = \sqrt{x^2 + y^2} = \sqrt{(r \cos t)^2 + (r \sin t)^2}$  funksiya uzluksiz. Demak,

$$\int_{AB} \sqrt{x^2 + y^2} ds = \int_0^\pi \sqrt{(r \cos t)^2 + (r \sin t)^2} \sqrt{(r \cos t)^2 + (r \sin t)^2} dt = r^2 \int_0^\pi dt = \pi r^2$$

bo'ladi. ▶

**5°. Birinchi tur egri chiziqli integrallarning ba'zi bir tatlbiqlari.** Birinchi tur egri chiziqli integrallar yordamida yoy uzunligini, jismning massasini, og'irlik markazlarini topish mumkin.

Tekislikda sodda  $AB$  egri chiziq berilgan bo'lsin. Bu chiziqda  $f(x, y) = 1$  funksiyani qaraylik. Ravshanki, bu funksiya  $AB$  da uzluksiz.  $f(x, y)$  funksiyaning birinchi tur egri chiziqli integrali ta'rifidan quyidagini topamiz:

$$\int_{AB} 1 ds = \lim_{\lambda_p \rightarrow 0} \sum_{k=0}^{n-1} |\Delta s_k| = \lim_{\lambda_p \rightarrow 0} \sum_{k=0}^{n-1} \Delta s_k = S.$$

Demak,

$$S = \int_{AB} ds. \quad (18.9)$$

### 18.2-misol Ushbu

$$\begin{aligned} x &= x(t) = a \cos^3 t, \\ y &= y(t) = a \sin^3 t \end{aligned}$$

sistema bilan berilgan  $AB$  chiziqning uzunligi topilsin. (Bu chiziq astroidani ifodalaydi).

◀ Yuqoridagi formulaga ko'ra astroidaning uzunligi

$$S = \int_{AB} ds$$

bo'ladi. Astroida koordinata o'qlariga nisbatan simmetrik bo'lishini e'tiborga olib, yuqorida keltirilgan (18.9) formuladan foydalananib quyidagini topamiz:

$$\begin{aligned} \int_{AH}^y ds &= 4 \int_0^{\pi/2} \sqrt{x'^2(t) + y'^2(t)} dt = 4 \int_0^{\pi/2} \sqrt{(-3a \cos^2 t \sin t)^2 + (3a \sin^2 t \cos t)^2} dt = \\ &= 4 \int_0^{\pi/2} \sqrt{\frac{9a^2}{4} \sin^2 2t} dt = 6a \int_0^{\pi/2} \sin 2t dt = 6a \left( -\frac{\cos 2t}{2} \right) \Big|_0^{\pi/2} = 6a \end{aligned}$$

## 2-§. Ikkinchı tur egri chiziqli integrallar

**1º. Ikkinchı tur egri chiziqli integrallar ta'rifi.** Tekislikda biror sodda  $AB$  egri chiziqni qaraylik. Bu egri chiziqda  $f(x, y)$  funksiya berilgan bo'linsin.  $AB$  egri chiziqning

$$P = \{A_0, A_1, \dots, A_n\}$$

bo'laklanishini va uning har bir  $A_k A_{k+1}$  ( $k = 0, 1, 2, \dots, n-1$ ) yoyida ixtiyoriy  $Q_k = (\xi_k, \eta_k)$  nuqtani ( $Q_k = (\xi_k, \eta_k) \in A_k A_{k+1}$ ,  $k = 0, 1, 2, \dots, n-1$ ) olaylik. Berilgan funksiyaning  $Q_k = (\xi_k, \eta_k)$  nuqtadagi  $f(\xi_k, \eta_k)$  qiymatini  $A_k A_{k+1}$  ning  $Ox$  ( $Oy$ ) o'qidagi  $\Delta x_k$  ( $\Delta y_k$ ) proeksiyasiga ko'paytirib quyidagi yig'indini tuzamiz:

$$\sigma' = \sum_{k=0}^{n-1} f(\xi_k, \eta_k) \Delta x_k \quad \left( \sigma'' = \sum_{k=0}^{n-1} f(\xi_k, \eta_k) \Delta y_k \right). \quad (18.10)$$

Endi  $AB$  egri chiziqning shunday

$$P_1, P_2, \dots, P_m, \dots \quad (18.11)$$

bo'laklari ketma-ketligini qaraymizki. ularning diametrlaridan tashkil topgan mos

$$\lambda_{P_1}, \lambda_{P_2}, \dots, \lambda_{P_m}, \dots$$

ketma-ketlik nolga intilsin:

$$\lambda_{P_m} \rightarrow 0.$$

Bunday bo'laklashlarga nisbatan (18.10) kabi yig'indilarni tuzib ushbu

$$\sigma'_1, \sigma'_2, \dots, \sigma'_m, \dots (\sigma''_1, \sigma''_2, \dots, \sigma''_m, \dots)$$

ketma-ketlikni hosil qilamiz.

**4-ta'rif.** Agar  $AB$  egri chiziqning har qanday (18.11) ko'rinishdagи bo'laklashlari ketma-ketligi  $\{P_n\}$  olinganda ham, unga mos yig'indilardan iborat  $\{\sigma'_n\}$  ( $\{\sigma''_n\}$ ) ketma-ketlik  $(\xi_k, \eta_k)$  nuqtalarning  $((\xi_k, \eta_k) \in A_k A_{k+1})$  tanlab olinishiga bog'liq bo'limgagan ravishda hamma vaqt bitta  $J'$  songa ( $J''$  songa) intilsa, bu son  $\sigma'$  ( $\sigma''$ ) yig'indining limiti deb ataladi va

$$\begin{aligned} \lim_{\lambda_p \rightarrow 0} \sigma' &= \lim_{\lambda_p \rightarrow 0} \sum_{k=0}^{n-1} f(\xi_k, \eta_k) \Delta x_k = J' \\ \left( \lim_{\lambda_p \rightarrow 0} \sigma'' = \lim_{\lambda_p \rightarrow 0} \sum_{k=0}^{n-1} f(\xi_k, \eta_k) \Delta y_k = J'' \right) \end{aligned} \quad (18.12)$$

kabi belgilanadi.  $\sigma'$  ( $\sigma''$ ) yig'indining bu limitini quyidagicha ham ta'riflash mumkin.

**5-ta'rif.** Agar  $\forall \varepsilon > 0$  olinganda ham, shunday  $\delta > 0$  topilsaki,  $AB$  egrisi chiziqning diametri  $\lambda_p < \delta$  bo'lgan har qanday  $P$  bo'laklash uchun tuzilgan  $\sigma'$  ( $\sigma''$ ) yig'indi ixtiyoriy  $(\xi_k, \eta_k)$  nuqtalarda  $((\xi_k, \eta_k) \in A_k A_{k+1}, k = 0, 1, 2, \dots, n-1)$

$$|\sigma' - J'| < \varepsilon \quad (\sigma'' - J'' < \varepsilon)$$

tengsizlikni bajarsa,  $J'$  son ( $J''$  son)  $\sigma'$  yig'indining ( $\sigma''$ ) yig'indining  $\lambda_p \rightarrow 0$  dagi limiti deb ataladi va (18.12) kabi belgilanadi.

Yig'indi limitining bu ta'riflari ekvivalent ta'riflardir.

**6-ta'rif.** Agar  $\lambda_p \rightarrow 0$  da  $\sigma'$  yig'indi ( $\sigma''$ ) yig'indi chekli limitga ega bo'lsa,  $f(x, y)$  funksiya  $AB$  egrisi chiziq bo'yicha integrallanuvchi deyiladi. Bu limit  $f(x, y)$  funksiyaning  $AB$  egrisi chiziq bo'yicha ikkinchi tur egrisi chiziqli integrali deb ataladi va u

$$\int_{AB} f(x, y) dx \quad \left( \int_{AB} f(x, y) dy \right)$$

kabi belgilanadi. Demak,

$$\begin{aligned} \int_{AB} f(x, y) dx &= \lim_{\lambda_p \rightarrow 0} \sigma' = \lim_{\lambda_p \rightarrow 0} \sum_{k=0}^{n-1} f(\xi_k, \eta_k) \Delta x_k, \\ \left( \int_{AB} f(x, y) dy \right) &= \lim_{\lambda_p \rightarrow 0} \sigma'' = \lim_{\lambda_p \rightarrow 0} \sum_{k=0}^{n-1} f(\xi_k, \eta_k) \Delta y_k. \end{aligned}$$

Shunday qilib,  $AB$  egrisi chiziqda berilgan  $f(x, y)$  funksiyadan ikkita  $Ox$  o'qidagi proeksiyalar vositasida va  $Oy$  o'qidagi proeksiyalar vositasida olingan ikkinchi tur egrisi chiziqli integral tushunchalar kiritildi.

Faraz qilaylik,  $AB$  egrisi chiziqda ikkita  $P(x, y)$  va  $Q(x, y)$  funksiyalar berilgan bo'lib,  $\int_{AB} P(x, y) dx$ ,  $\int_{AB} Q(x, y) dy$  lar esa ularning ikkinchi tur egrisi chiziqli integralлари bo'lsin. Ushbu

$$\int_{AB} P(x, y) dx + \int_{AB} Q(x, y) dy$$

yig'indi ikkinchi tur egrisi chiziqli integralning umumiy ko'rinishi deb ataladi va

$$\int_{AB} P(x, y) dx + Q(x, y) dy$$

kabi yoziladi. Demak,

$$\int_{AB} P(x, y) dx + Q(x, y) dy = \int_{AB} P(x, y) dx + \int_{AB} Q(x, y) dy.$$

Ikkinchi tur egrisi chiziqli integral ta'risidan quyidagi natijalar kelib chiqadi.

**3-natija.** Ikkinchi tur egrisi chiziqli integral egrisi chiziqning yo'naliishiga bog'liq bo'ladi. Shuni isbotlaylik

Ma'lumki,  $AB$  egrisi chiziqda ikkita yo'naliish ( $A$  nuqtadan  $B$  nuqtaga va  $B$  nuqtadan  $A$  nuqtaga) olish mumkin ( $AB, BA, A \neq B$ ).

*AB* egri chiziqning yuqoridagi *P* bo'laklashni olib, bu bo'laklashga nishbatan (18.10) yig'indini tuzamiz:

$$\sigma' = \sum_{k=0}^{n-1} f(\xi_k, \eta_k) \Delta x_k \quad (\Delta x_k = x_{k+1} - x_k).$$

Aytaylik,  $\lambda_p \rightarrow 0$  da bu yig'indi chekli limitga ega bo'lsin:

$$\lim_{\lambda_p \rightarrow 0} \sum_{k=0}^{n-1} f(\xi_k, \eta_k) \Delta x_k = \int_A f(x, y) dx.$$

Endi *AB* ning o'sha *P* bo'laklashini hamda har bir  $A_k A_{k+1}$  dagi o'sha  $(\xi_k, \eta_k)$  nuqtalami olib, *AB* egri chiziqning yo'nalishini esa *B* dan *A* ga qarab deb ushbu yig'indini tuzamiz:

$$\sigma' = \sum_{k=0}^{n-1} f(\xi_k, \eta_k) (x_k - x_{k+1})$$

$\lambda_p \rightarrow 0$  da bu yig'indi chekli limitga ega bo'lsa, u ta'risga binoan ushbu

$$\int_A f(x, y) dx$$

integral bo'ladi:

$$\lim_{\lambda_p \rightarrow 0} \sigma' = \lim_{\lambda_p \rightarrow 0} \sum_{k=0}^{n-1} f(\xi_k, \eta_k) (x_k - x_{k+1}) = \int_A f(x, y) dx.$$

Agar

$$\sigma' = \sum_{k=0}^{n-1} f(\xi_k, \eta_k) \cdot \Delta x_k = - \sum_{k=0}^{n-1} f(\xi_k, \eta_k) \cdot (x_k - x_{k+1}) = -\bar{\sigma}'$$

ekanligini e'tiborga olsak, u holda  $\lambda_p \rightarrow 0$  da  $\sigma'$  yig'indining chekli limitga ega bo'lishidan  $\bar{\sigma}'$  yig'indining ham chekli limitga ega bo'lishi va  $\lim_{\lambda_p \rightarrow 0} \sigma' = -\lim_{\lambda_p \rightarrow 0} \bar{\sigma}'$

tenglikning hajarilishini topamiz. Demak,

$$\int_A f(x, y) dx = - \int_B f(x, y) dx.$$

Xuddi shunga o'xshash

$$\int_A f(x, y) dy = - \int_B f(x, y) dy$$

bo'ladi.

**4-natija.** *AB* egri chiziq *Ox* o'qiga (*Oy* o'qiga) perpendikulyar bo'lgan to'g'ri chiziq kesmasidan iborat bo'llib,  $f(x, y)$  funksiya shu chiziqdagi berilgan bo'lsin.

U holda

$$\int_A f(x, y) dx = \left( \int_A f(x, y) dy \right)$$

mavjud va

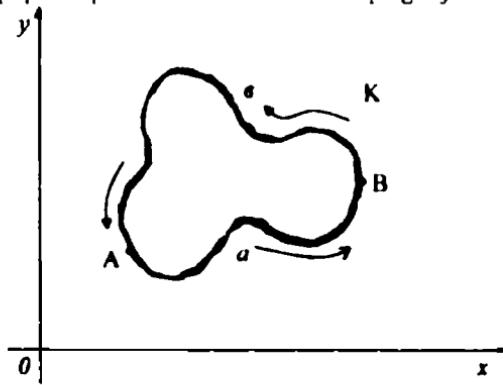

$$\int_B f(x, y) dx = 0 \quad \left( \int_B f(x, y) dy = 0 \right)$$

bo'ladi.

Bu tenglik bevosita ikkinchi tur egri chiziqli integral ta'rifidan kelib chiqadi.

Endi  $AB$ -sodda yopiq egri chiziq bo'lsin, ya'nî  $A$  va  $B$  nuqtalar usima-ust tushsin. Bu yopiq chiziqnı  $K$  deb belgilaylik. Bu sodda yopiq chiziqdə ham ikki yo'nalish bo'ladi. Ularning birini musbat yo'nalish, ikkinchisini manfiy yo'nalish deb qabul qilaylik. Shunday yo'nalishni musbat deb qabul qilamizki, kuzatuvchi yopiq chiziq bo'ylab harakat qilganda, yopiq chiziq bilan chegaralangan soha unga nisbatan har doim chap tomonda yotsin.

Faraz qilaylik, sodda yopiq chiziqdə  $f(x, y)$  funksiya berilgan bo'lsin. Bu  $K$  chiziqdə ixtiyoriy ikkita turli nuqtalarnı olib, ularni  $A$  va  $B$  bilan belgilaylik. Natijada,  $K$  yopiq chiziq ikkita  $AaB$  va  $BaA$  chiziqlarga ajraladi (61-chizma).

61-chizma

Ushbu

$$\int\limits_{AaB} f(x, y) dx + \int\limits_{BaA} f(x, y) dx$$

integral (agar u mavjud bo'lsa)  $f(x, y)$  funksiyaning  $K$  yopiq chiziq bo'yicha ikkinchi tur egri chiziqli integrali deb ataladi va

$$\int\limits_K f(x, y) dx \text{ yoki } \int\limits_K f(x, y) dy$$

kabi belgilanadi. Bunda  $K$  yopiq chiziqning musbat yo'nalishi olingan. (Bundan buyon yopiq chiziq bo'yicha olingan integrallarda, yopiq chiziq musbat yo'nalishda deb qaraymiz). Demak,

$$\int\limits_A f(x, y) dx = \int\limits_{AaB} f(x, y) dx + \int\limits_{BaA} f(x, y) dx .$$

Xuddi shunga o'xshash

$$\int\limits_K f(x, y) dy$$

hamda, umumiy holda

$$\int\limits_A P(x, y) dx + Q(x, y) dy$$

integrallar ta'riflanadi.

$AB$  fazoviy egri chiziq bo'lib, bu chiziqdagi  $f(x, y, z)$  funksiya berilgan bo'lisin. Yuqoridaqidek,  $f(x, y, z)$  funksiyaning  $AB$  egri chiziq bo'yicha ikkinchi tur egri chiziqli integrallari ta'riflanadi va ular

$$\int\limits_{AB} f(x, y, z) dx, \int\limits_{AB} f(x, y, z) dy, \int\limits_{AB} f(x, y, z) dz$$

kabi belgilanadi. Umumiy holda,  $P(x, y, z)$ ,  $Q(x, y, z)$ ,  $R(x, y, z)$  funksiyalar berilgan bo'lib, ushbu

$$\int\limits_{AB} P(x, y, z) dx, \int\limits_{AB} Q(x, y, z) dy, \int\limits_{AB} R(x, y, z) dz$$

integrallar mavjud bo'lsa,

$$\int\limits_{AB} P(x, y, z) dx + \int\limits_{AB} Q(x, y, z) dy + \int\limits_{AB} R(x, y, z) dz$$

yig'indi ikkinchi tur egri chiziqli integralning umumiy ko'rinishi deb ataladi va u

$$\int\limits_{AB} P(x, y, z) dx + Q(x, y, z) dy + R(x, y, z) dz$$

kabi belgilanadi. Demak,

$$\begin{aligned} & \int\limits_{AB} P(x, y, z) dx + Q(x, y, z) dy + R(x, y, z) dz = \\ & = \int\limits_{AB} P(x, y, z) dx + \int\limits_{AB} Q(x, y, z) dy + \int\limits_{AB} R(x, y, z) dz. \end{aligned}$$

**2<sup>o</sup>. Uzluksiz funksiya ikkinchi tur egri chiziqli integrali.** Faraz qilaylik,  $AB$  egri chiziq ushbu

$$\begin{cases} x = \varphi(t) \\ y = \psi(t) \end{cases}, \quad (\alpha < t < \beta) \quad (18.13)$$

sistema bilan (parametrik ko'rinishda) berilgan bo'lisin. Bunda  $\varphi(t)$  funksiya  $[\alpha, \beta]$  da  $\varphi'(t)$  hosilaga ega va bu hosila shu oraliqda uzluksiz,  $\psi(t)$  funksiya ham  $[\alpha, \beta]$  da uzluksiz hamda  $(\varphi(\alpha), \psi(\alpha)) = A$  va  $(\varphi(\beta), \psi(\beta)) = B$  bo'lisin.

$t$  parametr  $\alpha$  dan  $\beta$  ga qarab o'zgarganda  $(x, y) = (\varphi(t), \psi(t))$  nuqta  $A$  dan  $B$  ga qarab  $AB$  ni chiza borsin.

**3-teorema.** Agar  $f(x, y)$  funksiya  $AB$  da uzluksiz bo'lsa, u holda bu funksiyaning  $AB$  egri chiziq bo'yicha ikkinchi tur egri chiziqli integrali

$$\int\limits_{AB} f(x, y) dx$$

mavjud va

$$\int\limits_{AB} f(x, y) dx = \int\limits_a^b f(\varphi(t), \psi(t)) \cdot \varphi'(t) dt$$

bo'ladi.

►  $[\alpha, \beta]$  oraliqning

$$P = \{t_0, t_1, \dots, t_n\}, \quad (\alpha = t_0 < t_1 < \dots < t_n = \beta)$$

bo'laklashini olaylik. Bu bo'laklashning bo'luvchi nuqtalari  $t_k$  ( $k = 0, 1, 2, \dots, n$ ) ning  $AB$  dagi mos akslarini  $A_k$  deylik ( $k = 0, 1, 2, \dots, n$ ). Ravshanki, bu  $A_k$  nuqtalar  $AB$  egri chiziqning

$$\{A_0, A_1, \dots, A_n\}$$

bo'laklashini hosil qiladi. Bundan  $A_k = (\varphi(t_k), \psi(t_k))$  ( $k = 0, 1, 2, \dots, n$ ) bo'ladi. Bu bo'laklashga nisbatan (18.10) yig'indini

$$\sigma' = \sum_{k=0}^{n-1} f(\xi_k, \eta_k) \Delta t_k$$

tuzamiz. Keyingi tenglikda  $\Delta x_k = A_k A_{k+1}$  ning  $Ox$  o'qdagi proeksiyasi

$$\Delta x_k = x_{k+1} - x_k = \varphi(t_{k+1}) - \varphi(t_k)$$

ga tengdir.

Lagranj teoremasidan foydalaniib topamiz:

$$\varphi(t_{k+1}) - \varphi(t_k) = \varphi'(\theta_k)(t_{k+1} - t_k) = \varphi'(\theta_k) \Delta t_k \quad (\theta_k \in [t_k, t_{k+1}]).$$

Ma'lumki,  $(\xi_k, \eta_k) \in A_k A_{k+1}$ , ( $k = 0, 1, 2, \dots, n-1$ ). Agar bu  $(\xi_k, \eta_k)$  nuqtaga akslanuvchi nuqtani  $r_k$  ( $r_k \in [t_k, t_{k+1}]$ ) deyilsa, unda

$$\xi_k = \varphi(r_k), \eta_k = \psi(r_k)$$

bo'ladi. Natijada  $\sigma'$  yig'indi quyidagi ko'rinishga keladi:

$$\sigma' = \sum_{k=0}^{n-1} f(\varphi(r_k), \psi(r_k)) \varphi'(\theta_k) \cdot \Delta t_k.$$

Endi  $\lambda_p^* = \max \{\Delta t_k\} \rightarrow 0$  da (bu holda  $\lambda_p$  ham nolga intiladi)  $\sigma'$  yig'indining limitini topish maqsadida uning ifodasini o'zgartirib quyidagicha yozamiz:

$$\sigma' = \sum_{k=0}^{n-1} f(\varphi(r_k), \psi(r_k)) \cdot \varphi'(r_k) \Delta t_k + \sum_{k=0}^{n-1} f(\varphi(r_k), \psi(r_k)) [\varphi'(\theta_k) - \varphi'(r_k)] \Delta t_k. \quad (18.14)$$

Bu tenglikning o'ng tomonidagi ikkinchi qo'shiluvchini baholaymiz:

$$\begin{aligned} & \left| \sum_{k=0}^{n-1} f(\varphi(r_k), \psi(r_k)) [\varphi'(\theta_k) - \varphi'(r_k)] \Delta t_k \right| \leq \\ & \leq \sum_{k=0}^{n-1} |f(\varphi(r_k), \psi(r_k))| |\varphi'(\theta_k) - \varphi'(r_k)| \cdot \Delta t_k \leq \\ & \leq M \sum_{k=0}^{n-1} |\varphi'(\theta_k) - \varphi'(r_k)| \cdot \Delta t_k \end{aligned}$$

bunda

$$M = \max_{\alpha \leq r \leq \beta} |f(\varphi(r), \psi(r))|.$$

$\varphi'(t)$  funksiya  $[\alpha, \beta]$  da uzlusiz. U holda Kantor teoremasining natijasiga ko'rta,  $\forall \varepsilon > 0$  olinganda ham shunday  $\delta > 0$  topiladi,  $[\alpha, \beta]$  oraliqning diametri  $\lambda_p^* < \delta$  bo'ligan har qanday  $P$  bo'linish uchun

$$|\varphi'(\theta_k) - \varphi'(r_k)| < \frac{\varepsilon}{M(\beta - \alpha)} \quad (\theta_k, r_k \in [t_k, t_{k+1}])$$

bo'ladi. Unda

$$\begin{aligned} & \left| \sum_{k=0}^{n-1} f(\varphi(r_k), \psi(r_k)) [\varphi'(\theta_k) - \varphi'(r_k)] \Delta t_k \right| < \\ & < M \sum_{k=0}^{n-1} M \frac{\varepsilon}{(\beta - \alpha)} \Delta t_k = \frac{\varepsilon}{\beta - \alpha} \sum_{k=0}^{n-1} \Delta t_k = \varepsilon \end{aligned}$$

Demak,

$$\lim_{\substack{i \rightarrow 0 \\ k \rightarrow \infty}} \sum_{k=0}^{n-1} f(\varphi(r_k), \psi(r_k)) [\varphi'(r_k) - \varphi'(r_i)] \Delta t_i = 0$$

bo'ladi. Bu munosabatni e'tiborga olib, (18.14) tenglikda  $\lambda_p \rightarrow 0$  da limitga o'tib quyidagini topamiz:

$$\lim_{\substack{i \rightarrow 0 \\ k \rightarrow \infty}} \sigma' = \lim_{\substack{i \rightarrow 0 \\ k \rightarrow \infty}} \sum_{k=0}^{n-1} f(\varphi(r_k), \psi(r_k)) \varphi'(r_k) \Delta t_i = \int_a^b f(\varphi(t), \psi(t)) \varphi'(t) dt.$$

Demak,

$$\int_A B f(x, y) dx = \int_a^b f(\varphi(t), \psi(t)) \varphi'(t) dt.$$

Endi (18.13) sistemada  $\varphi(t)$  funksiya  $[\alpha, \beta]$  da uzlusiz,  $\psi(t)$  funksiya esa  $[\alpha, \beta]$  da  $\psi'(t)$  hosilaga ega va bu hosila shu oraliqda uzlusiz bo'lsin.

**4-teorema.** Agar  $f(x, y)$  funksiya  $AB$  da uzlusiz bo'lsa, u holda bu funksiyaning  $AB$  egri chiziq bo'yicha olingan ikkinchi tur egri chiziqli integrali

$$\int_A B f(x, y) dy$$

mavjud va

$$\int_A B f(x, y) dy = \int_a^b f(\varphi(t), \psi(t)) \psi'(t) dt$$

bo'ladi.

Bu teorema yuqoridagi 3-teorema kabi isbotlanadi.

Yuqoridagi teoremlar, bir tomonidan, uzlusiz funksiya ikkinchi tur egri chiziqli integralining mavjudligini aniqlab bersa, ikkinchi tomonidan, bu integral aniq integral (Riman integrali) orqali ifodalanishini ko'rsatadi.

$AB$  egri chiziq (18.13) sistema bilan berilgan bo'lib,  $\varphi(t), \psi(t)$  funksiyalar  $[\alpha, \beta]$  da  $\varphi'(t), \psi'(t)$  hosilalarga ega va u bu hosilalar uzlusiz bo'lsin.

Agar  $AB$  egri chiziqda ikkita  $P(x, y)$  va  $Q(x, y)$  funksiyalar berilgan bo'lib, ular shu chiziqda uzlusiz bo'lsa, u holda

$$\int_A B P(x, y) dx + Q(x, y) dy = \int_a^b [P(\varphi(t), \psi(t)) \varphi'(t) + Q(\varphi(t), \psi(t)) \psi'(t)] dt$$

bo'ladi.

**3<sup>o</sup>. Ikkinchi tur egri chiziqli integralning xossalari.** Yuqorida keltirilgan teoremlar uzlusiz funksiyalarning ikkinchi tur egri chiziqli integrallarini, bizga ma'lum bo'lgan aniq integral-Riman integrallariga kelishini ko'rsatadi. Binobarin, bu egri chiziqli integrallar Riman integrallari xossalari kabi xossalarga ega bo'ladi. O'tgan paragrafda esa xuddi shunday mulohaza birinchi tur egri chiziqli integrallarga nisbatan bo'lgan edi. Shularni e'tiborga olib, ikkinchi tur egri chiziqli integrallarning xossalalarini keltirishni va tegishli xulosalar chiqarishni o'quvchiga havola etamiz.

**4<sup>o</sup>. Ikkinchi tur egri chiziqli integrallarni hisoblash.** Yuqorida keltirilgan teoremlar funksiyaning ikkinchi tur egri chiziqli integrallarining mavjudligini tasdiqlabgina qolmasdan ularni hisoblash yo'lini ko'rsatadi. Demak, ikkinchi tur egri chiziqli integrallar ham, asosan Riman integrallariga keltirilib hisoblanadi:

$$\int\limits_{AB} f(x,y)dx = \int\limits_a^b f(\varphi(t),\psi(t)) |\varphi'(t)|dt, \quad (18.15)$$

$$\int\limits_{AB} f(x,y)dy = \int\limits_a^b f(\varphi(t),\psi(t)) |\psi'(t)|dt, \quad (18.16)$$

$$\int\limits_{AB} P(x,y)dx + Q(x,y)dy = \int\limits_a^b [P(\varphi(t),\psi(t))|\varphi'(t)| + Q(\varphi(t),\psi(t))|\psi'(t)|]dt \quad (18.17)$$

Xususan,  $AB$  egri chiziq

$$y = y(x) \quad (a < x < b)$$

tenglama bilan aniqlangan bo'lib,  $y(x)$  funksiya  $[a, b]$  da hosilaga ega va u uzliksiz bo'lsa, (18.15), (18.17) formulalar quyidagi

$$\int\limits_{AB} f(x,y)dx = \int\limits_a^b f(x, y(x))dx, \quad (18.18)$$

$$\int\limits_{AB} P(x,y)dx + Q(x,y)dy = \int\limits_a^b [P(x,y(x)) + Q(x,y(x))y'(x)]dx$$

ko'rinishga keladi.

Shuningdek,  $AB$  egri chiziq

$$x = x(y) \quad (c < y < d)$$

tenglama bilan aniqlangan bo'lib,  $x(y)$  funksiya  $[c, d]$  oraliqda hosilaga ega va u uzliksiz bo'lsa, (18.16) va (18.17) formulalar quyidagi

$$\int\limits_{AB} f(x,y)dy = \int\limits_c^d f(x(y), y)dy, \quad (18.19)$$

$$\int\limits_{AB} P(x,y)dx + Q(x,y)dy = \int\limits_c^d [P(x(y), y) x'(y) + Q(x(y), y)]dy \quad (18.20)$$

ko'rinishga keladi.

### 18.3-misol. Ushbu

$$\int\limits_{AB} y^2 dx + x^2 dy$$

integral hisoblanisin, bunda  $\tilde{AB} - \frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$  ellipsning yuqori yarim tekislikdagi qismidan iborat.

► Ma'lumki, ellipsning parametrik tenglamasi quyidagicha bo'ladи:

$$x = a \cos t,$$

$$y = b \sin t.$$

$A = (a, 0)$  nuqtaga parametr  $t$  ning  $t = 0$  qiymati,  $B = (-a, 0)$  nuqtaga esa  $t = \pi$  qiymati mos kelib,  $t$  parametr  $0$  dan  $\pi$  gacha o'zgarganda  $(x, y)$  nuqta  $A$  dan  $B$  ga qarab ellipsning yuqori yarim tekislikdagi qismini chizib chiqadi.

$P(x,y) = y^2$ ,  $Q(x,y) = x^2$  funksiyalar esa  $\tilde{AB}$  da uzliksiz. (18.17) formuladan foydalaniб quyidagini topamiz:

$$\begin{aligned} \int\limits_{AB} y^2 dx + x^2 dy &= \int\limits_0^\pi [a^2 \sin^2 t (-a \sin t) + a^2 \cos^2 t \cdot a \cos t] dt = \\ &= a^3 \int\limits_0^\pi (a \cos^3 t - a \sin^3 t) dt = -\frac{4}{3} a^3. \blacksquare \end{aligned}$$

18.4-misol. Ushbu

$$\int\limits_{AH} 3x^2 y dx + (x^3 + 1) dy$$

integral hisoblanisin, bunda  $AB$  egri chiziq:

a)  $(0,0)$  nuqtadan chiqqan  $(0,0)$  va  $(1,1)$  nuqtalarni birlashtiruvchi to'g'ri chiziq kesmasi;

b)  $(0,0)$  nuqtadan chiqqan  $(0,0)$  va  $(1,1)$  nuqtalarni birlashtiruvchi  $y = x^2$  parabolaning yoyi;

v)  $(0,0)$  nuqtadan chiqqan  $(0,0)$ ,  $(1,0)$  va  $(1,1)$  nuqtalarni birlashtiruvchi siniq chiziqdan iborat.

Yuqoridaagi (18.18), (18.19) va (18.20) formulalardan foydalaniib quyidagilarni topamiz:

a) holda

$$\int\limits_{AB} 3x^2 y dx + (x^3 + 1) dy = \int\limits_0^1 [3x^2 x + (x^3 + 1)] dx = \int\limits_0^1 (4x^3 + 1) dx = 2,$$

b) holda

$$\int\limits_{AH} 3x^2 y dx + (x^3 + 1) dy = \int\limits_0^1 [3x^2 x^2 + (x^3 + 1)x] dx = \int\limits_0^1 (5x^4 + 2x) dx = 2,$$

v) holda

$$\int\limits_{AC} 3x^2 y dx + (x^3 + 1) dy = \int\limits_{AC} 3x^2 y dx + (x^3 + 1) dy + \int\limits_{CB} 3x^2 y dx + (x^3 + 1) dy$$

bunda  $AC$  -  $(0,0)$  va  $(1,0)$  nuqtalarni  $CB$  -  $(1,0)$  va  $(1,1)$  nuqtalarni birlashtiruvchi to'g'ri chiziq kasmalaridan iborat

Ravshanki,

$$\int\limits_{AC} 3x^2 y dx + (x^3 + 1) dy = 0 \quad \int\limits_{CB} 3x^2 y dx + (x^3 + 1) dy = \int\limits_0^1 2 dy = 2.$$

Demak,

$$\int\limits_{AH} 3x^2 y dx + (x^3 + 1) dy = 2. \blacksquare$$

### 3-§. Grin formulasi va uning tatlighlari

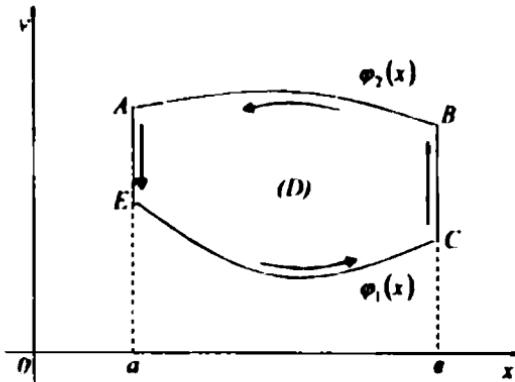

Ma'lumki, Nyuton-Leybnits formulasi  $f(x)$  funksiyaning  $[a, b]$  oraliq bo'yicha olingan aniq integralini shu funksiya boshlang'ich funksiyasining oraliq chekkalari (chegaralari) dagi qiymatlari orqali ifodalar edi.

Biror  $(D)$  sohada  $((D) \subset R^2)$  berilgan  $f(x,y)$  uzlucksiz funksiyaning ikki karrali

$$\iint_D f(x, y) dx dy$$

integralini tegishli funksiyaning shu soha chegarasidagi qiymatlari orqali (aniqrog'i, soha chegarasi bo'yicha olingan egri chiziqli integrali orqali) ifodalaydigan formula ham mavjud. Quyida bu formulani keltiramiz.

**1°. Grin formulasi.** Yuqorida  $y = \varphi_2(x)$  ( $a < x \leq b$ ) funksiya grafigi, yon tomonlardan  $x = a$ ,  $x = b$  vertikal chiziqlar hamda pastdan  $y = \varphi_1(x)$  ( $a \leq x \leq b$ ) funksiya grafigi bilan chegaralangan soha egri chiziqli trapesiyani qaraylik. Bu sohani ( $D$ ) bilan, uning chegarasi – yopiq chiziqnini  $\partial D$  bilan belgilaylik (62-chizma).

62-chizma

Ravshanki,  $AB - \varphi_2(x)$  funksiya grafigi,  $\bar{E}C - \varphi_1(x)$  funksiya grafigi hamda  $\partial D = EC + CB + BA + AE$ .

$P(x, y)$  funksiya shu ( $D$ ) sohada uzlusiz bo'lib,  $\frac{\partial P(x, y)}{\partial y}$  xususiy hosilaga ega va u ham ( $D$ ) da uzlusiz bo'lsin. U holda ushbu

$$\iint_D \frac{\partial P(x, y)}{\partial y} dx dy$$

integral mavjud bo'ladi va 18-bobning 6-§ idagi formulaga ko'ra

$$\iint_D \frac{\partial P(x, y)}{\partial y} dx dy = \int_a^b \left( \int_{\varphi_1(x)}^{\varphi_2(x)} \frac{\partial P(x, y)}{\partial y} dy \right) dx$$

bo'ladi. Endi

$$\int_{\varphi_1(x)}^{\varphi_2(x)} \frac{\partial P(x, y)}{\partial y} dy = P(x, y) \Big|_{y=\varphi_1(x)}^{y=\varphi_2(x)} = P(x, \varphi_2(x)) - P(x, \varphi_1(x))$$

bo'lishini e'tiborga olib, quyidagini topamiz:

$$\iint_D \frac{\partial P(x, y)}{\partial y} dx dy = \int_a^b P(x, \varphi_2(x)) dx - \int_a^b P(x, \varphi_1(x)) dx$$

Ushbu bobning 2-§ idagi (18.18) formulaga binoan

$$\int\limits_{\sigma} P(x, \varphi_2(x))dx = \int\limits_{AB} P(x, y)dx, \quad \int\limits_{\tau} P(x, \varphi_1(x))dx = \int\limits_{EC} P(x, y)dx$$

bo'ldi. Demak,

$$\iint\limits_{(D)} \frac{\partial P(x, y)}{\partial y} dxdy = \int\limits_{AB} P(x, y)dx - \int\limits_{EC} P(x, y)dx = - \int\limits_{BA} P(x, y)dx - \int\limits_{CE} P(x, y)dx.$$

Ravshanki,

$$\int\limits_{CB} P(x, y)dx = 0, \quad \int\limits_{EA} P(x, y)dx = 0.$$

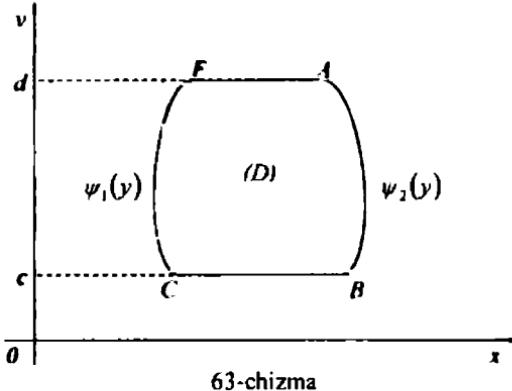

Bu tengliklarni hisobga olib quyidagini topamiz:

$$\iint\limits_{(D)} \frac{\partial P(x, y)}{\partial y} dxdy = - \int\limits_{EC} P(x, y)dx - \int\limits_{CB} P(x, y)dx - \int\limits_{BA} P(x, y)dx - \int\limits_{AE} P(x, y)dx = \\ = - \left( \int\limits_{EC} P(x, y)dx + \int\limits_{CB} P(x, y)dx + \int\limits_{BA} P(x, y)dx + \int\limits_{AE} P(x, y)dx \right) = - \int\limits_{\partial D} P(x, y)dx.$$

Demak,

$$\iint\limits_{(D)} \frac{\partial P(x, y)}{\partial y} dxdy = - \int\limits_{\partial D} P(x, y)dx \quad (18.21)$$

Endi, yuqorida  $y = c$ , pastdan  $y = d$  chiziqlar, yon tomonidan esa  $x = \psi_1(y)$ ,  $x = \psi_2(y)$  funksiyalar grafiklari bilan chegaralangan soha egri chiziqli trapesiyani qaraylik. Bu sohani  $(D)$  bilan, uning chegarasi – yopiq chiziqli  $\partial D$  bilan belgilaylik (63-chizma).

$Q(x, v)$  funksiya shu  $(D)$  sohada uzlusiz bo'lib,  $\frac{\partial Q(x, y)}{\partial x}$  xususiy hosilaga ega va bu hosila  $(D)$  da uzlusiz bo'lsin. U holda

$$\iint\limits_{(D)} \frac{\partial Q(x, y)}{\partial x} dxdy = \int\limits_{\partial D} Q(x, y)dy \quad (18.22)$$

bo'ldi.

Bu formulaning to'g'riligi yuqoridagidek mulhaza yuritish bilan isbotlanadi.

Endi  $R^+$  fazoda qaraladigan  $(D)$  soha yuqoridagi ikki holda qaralgan sohaning har birining xarakteriga ega bo'lgan soha bo'lsin,  $\partial D$  esa uning chegarasi bo'lsin. Bu  $(D)$  sohada ikkita  $P(x,y)$  va  $Q(x,y)$  funksiyalar uzluksiz bo'lib, ular  $\frac{\partial P(x,y)}{\partial y}, \frac{\partial Q(x,y)}{\partial x}$  xususiy hosilalarga ega hamda bu hosilalar ham  $(D)$  da uzluksiz bo'lsin. Ravshanki, bu holda (18.21) va (18.22) formulalar o'rinni bo'ladı. Ularni hadlab qo'shib ushbuni topamiz:

$$\int\limits_{\Omega} P(x,y)dx + Q(x,y)dy = \iint\limits_{(D)} \left( \frac{\partial Q(x,y)}{\partial x} - \frac{\partial P(x,y)}{\partial y} \right) dx dy. \quad (18.23)$$

Bu Grin formulasi deb ataladi.

Demak, Grin formulasi soha bo'yicha olingen ikki karrali integralni shu soha chegarasi bo'yicha olingen egri chiziqli integral bilan bog'laydigan formula ekan.

Biz yuqorida Grin formulasi maxsus ko'rinishdagi  $(D)$  sohalar (egri chiziqli trapesiyalar) uchun keltirdik. Aslida bu formula ancha keng sindagi sohalar uchun ham to'g'ri bo'lib, bu fakt u sohalarni chekli sondagi egri chiziqli trapesiyalar yig'indisi sifatida tasvirlash bilan isbot qilinadi.

#### 2º. Grin formulasining ba'zi bir tatlqlari.

1). *Shaklning yuzini topish.* Grin formulasidan foydalaniib, yassi shaklning yuzini sodda funksiyalarning egri chiziqli integrallari yordamida hisoblanishini ko'rsatish qiyin emas. Haqiqatdan ham, (18.23) formulada  $P(x,y) = -y$ ,  $Q(x,y) = 0$  deyilsa, u holda

$$\int\limits_{\Omega} (-y)dx = \iint\limits_{(D)} dx dy = D$$

bo'ladı. Demak,

$$D = - \int\limits_{\Omega} y dx.$$

Agar (18.23) formulada  $P(x,y) = 0$ ,  $Q(x,y) = x$  deyilsa, u holda

$$D = \int\limits_{\Omega} x dy \quad (18.24)$$

bo'ladı.

(18.23) formulada  $P(x,y) = -\frac{1}{2}y$ ,  $Q(x,y) = \frac{1}{2}x$  deb olinsa,  $(D)$  sohaning yuzi

$$D = \frac{1}{2} \int\limits_{\partial D} x dy - y dx \quad (18.25)$$

bo'ladı.

#### 18.5-misol. Ushbu

$$\begin{cases} x = a \cos t, \\ y = b \sin t \end{cases} \quad (0 \leq t \leq 2\pi)$$

ellips bilan chegaralangan shaklning yuzi topilsin.

◀ (18.25) formulaga ko'ra

$$D = \frac{1}{2} \int_{\Delta} x dy - y dx = \frac{1}{2} \int_0^{2\pi} (a \cos t \cdot a \cos t + a \sin t \cdot a \sin t) dt = \\ = \frac{1}{2} a^2 \int_0^{2\pi} (\cos^2 t + \sin^2 t) dt = \pi a^2 \text{ bo'ladi. } \blacktriangleright$$

**3<sup>a</sup>. Ikki karrali integrallarni o'zgaruvchilarni almashtirib hisoblash.**  
Mazkur kursning 18-bob, 7-§ ida ( $\Delta$ ) sohani ( $D$ ) sohaga akslantiruvchi

$$\begin{aligned}x &= \varphi(u, v), \\y &= \psi(u, v)\end{aligned}$$

sistema o'sha paragrafda keltirilgan 1-3-shartlarni hajarganda ( $D$ ) sohaning yuzi

$$D = \iint_{(S)} J(u, v) dudv = \iint_{(D)} \frac{|D(x, y)|}{|D(u, v)|} dudv$$

bo'lishi aytilgan edi. Grin formulasidan foydalaniib, shu formulaning to'g'riligini isbotlaymiz.

Avvalo (18.24) formuladan foydalaniib, ( $D$ ) sohaning yuzi

$$D = \int_{\Delta} x dy \quad (18.26)$$

bo'lishini topamiz. Faraz qilaylik,  $\partial\Delta$  chiziq parametrik formada ushbu

$$\begin{aligned}u &= u(t) & (\alpha \leq t \leq \beta) \text{ yoki } (\alpha > t \geq \beta) \\v &= v(t)\end{aligned}$$

sistema bilan ifodalansin. U holda quyidagi

$$\begin{aligned}x &= \varphi(u, v) = \varphi(u(t), v(t)), \\y &= \psi(u, v) = \psi(u(t), v(t))\end{aligned}$$

sistema ( $D$ ) sohaning  $\partial D$  chegarasini ifodala'ydi. Bunda parametrning o'zgarish chegarasini shunday tanlab olamizki,  $t$  parametr  $\alpha$  dan  $\beta$  ga qarab o'zgarganda  $\partial D$  egri chiziq musbat yo'nalishda bo'lsin. U holda (18.26) tenglik ushbu

$$D = \int_{\Delta} x dy = \int_{\partial D} \varphi(u, v) \psi(u, v) - \int_{\alpha}^{\beta} \varphi(u(t), v(t)) \left| \frac{\partial \psi}{\partial u} u'(t) + \frac{\partial \psi}{\partial v} v'(t) \right| dt \quad (18.27)$$

ko'rinishga keladi.

Agar

$$\int_{(\Delta)} \varphi(u, v) \left[ \frac{\partial \psi}{\partial u} du + \frac{\partial \psi}{\partial v} dv \right] = \int_{\alpha}^{\beta} \varphi(u(t), v(t)) \left[ \frac{\partial \psi}{\partial u} u'(t) + \frac{\partial \psi}{\partial v} v'(t) \right] dt$$

bo'lishini e'tiborga olsak, u holda

$$D = \pm \int_{\Delta} x \frac{\partial \psi}{\partial u} du + x \frac{\partial \psi}{\partial v} dv \quad (18.28)$$

bo'lishini topamiz. Bu tenglikdagi integral belgisi oldiga quyilgan ishorani tushuntiramiz. Yuqorida,  $t$  parametr  $\alpha$  dan  $\beta$  ga qarab o'zgarganda  $\partial D$  egri chiziq musbat yo'nalishda bo'lishi aytdik. Bu holda  $\partial\Delta$  egri chiziqning yo'nalishi musbat ham bo'lishi mumkin, manfiy ham bo'lishi mumkin. Shuning uchun (18.27) va (18.28) munosabatlar bir-biridan ishora bilan farq qiladi. Agar  $\partial D$  egri chiziq musbat yo'nalishga  $\partial\Delta$  egri chiziqning ham musbat yo'nalishi mos kelsa, unda "Q" ishora olinadi, aks holda esa "-" ishora olinadi.

Endi ushbu

$$\int\limits_{\Delta} P(u, v) du + Q(u, v) dv = \iint\limits_{(\Delta)} \left( \frac{\partial Q(u, v)}{\partial u} - \frac{\partial P(u, v)}{\partial v} \right) du dv \quad (18.29)$$

Grin formulasida

$$P(u, v) = x \frac{\partial y}{\partial u}, \quad Q(x, y) = x \frac{\partial y}{\partial v}$$

deb olsak, u holda bu formula quyidagi ko'rinishga keladi:

$$\int\limits_{\Delta} x \frac{\partial y}{\partial u} du + x \frac{\partial y}{\partial v} dv = \iint\limits_{(\Delta)} \left[ \frac{\partial}{\partial u} \left( x \frac{\partial y}{\partial v} \right) - \frac{\partial}{\partial v} \left( x \frac{\partial y}{\partial u} \right) \right] du dv. \quad (18.30)$$

Agar

$$\frac{\partial}{\partial u} \left( x \frac{\partial y}{\partial v} \right) = \frac{\partial x}{\partial u} \frac{\partial y}{\partial v} + x \frac{\partial^2 y}{\partial v \partial u}, \quad \frac{\partial}{\partial v} \left( x \frac{\partial y}{\partial u} \right) = \frac{\partial x}{\partial v} \frac{\partial y}{\partial u} + x \frac{\partial^2 y}{\partial u \partial v}$$

va

$$\frac{\partial}{\partial u} \left( x \frac{\partial y}{\partial v} \right) - \frac{\partial}{\partial v} \left( x \frac{\partial y}{\partial u} \right) = \frac{\partial x}{\partial u} \frac{\partial y}{\partial v} - \frac{\partial x}{\partial v} \frac{\partial y}{\partial u} = \frac{D(x, y)}{D(u, v)}$$

ekanini e'tiborga olsak, unda (18.28), (18.29) va (18.30) munosabatlardan

$$D = \iint\limits_{(\Delta)} \frac{D(x, y)}{D(u, v)} du dv$$

bo'lishi kelib chiqadi.

Ma'lumki,

$$J(u, v) = \frac{D(x, y)}{D(u, v)}$$

yakobian aniq ishorali, ( $D$ ) esa ma'nosiga ko'ra musbat bo'lishi kerak. Demak, integral belgisi oldidagi ishora yakobianning ishorasi bilan bir xil bo'lish kerak. Shuning uchun

$$D = \iint\limits_{(\Delta)} \frac{|D(x, y)|}{|D(u, v)|} du dv$$

bo'ladi. Shuni isbotlash lozim edi.

**4. Egri chiziqli integral qiyomatining integrallash yo'liga bog'liq bo'lmasi**. Chegaralangan yopiq bog'lamli ( $D$ ) ( $\{(D) \subset R^2\}$ ) sohada ikkita  $P(x, y)$  va  $Q(x, y)$  funksiyalar berilgan bo'lsin. Bu funksiyalar ( $D$ ) sohada uzliksiz va  $\frac{\partial P(x, y)}{\partial y}, \frac{\partial Q(x, y)}{\partial x}$  xususiy hosilalarga ega va bu hosilalar ham shu sohada uzliksiz bo'lsin.

1) Agar ( $D$ ) sohada

$$\frac{\partial P(x, y)}{\partial y} = \frac{\partial Q(x, y)}{\partial x} \quad (18.31)$$

bo'lsa, u holda ( $D$ ) sohaga tegishli bo'lgan har qanday  $K$  yopiq chiziq bo'yicha olingan ushbu

$$\int\limits_K P(x, y) dx + Q(x, y) dy$$

integral nolga teng bo'ldi:

$$\int\limits_K P(x, y) dx + Q(x, y) dy = 0.$$

►  $K$  yopiq chiziq chegaralagan sohani ( $G$ ) deylik. Ravshanki,  $(G) \subset (D)$ . Grin formulasiga ko'ra

$$\int\limits_K P(x, y) dx + Q(x, y) dy = \iint\limits_{(G)} \left( \frac{\partial Q(x, y)}{\partial x} - \frac{\partial P(x, y)}{\partial y} \right) dx dy$$

bo'ldi. Shartga ko'ra ( $D$ ) da, demak, ( $G$ ) da

$$\frac{\partial P(x, y)}{\partial y} = \frac{\partial Q(x, y)}{\partial x}$$

U holda (18.31) munosahatdan

$$\iint\limits_{(G)} \left( \frac{\partial Q(x, y)}{\partial x} - \frac{\partial P(x, y)}{\partial y} \right) dx dy = 0$$

bo'ldi. Demak,

$$\int\limits_K P(x, y) dx + Q(x, y) dy = 0. \blacktriangleright$$

2) Agar ( $D$ ) sohaga tegishli bo'lgan har qanday  $K$  yopiq chiziq bo'yicha olingan ushbu integral

$$\int\limits_K P(x, y) dx + Q(x, y) dy = 0$$

bo'lsa, u holda quyidagi

$$\int\limits_{AB} P(x, y) dx + Q(x, y) dy \quad (AB \subset (D)) \quad (18.32)$$

integral  $A$  va  $B$  nuqtalarni birlashtiruvchi egri chiziqqa bog'liq bo'lmaydi, ya'ni (18.32) integral qiymati integrallash yo'lliga bog'liq bo'lmaydi.

► ( $D$ ) sohaning  $A$  va  $B$  nuqtalarni birlashtiruvchi va shu sohaga tegishli bo'lgan ixtiyoriy ikkita  $A \tilde{a} B$  hamda  $A \tilde{e} B$  egri chiziqni olaylik. Bu holda  $A \tilde{a} B$  va  $A \tilde{e} B$  egri chiziqlar birgalikda ( $D$ ) sohaga tegishli bo'lgan yopiq chiziqni tashkil etadi. Uni  $K$  bilan belgilaylik:

$$K = A \tilde{a} B \tilde{e} A.$$

Shartga ko'ra

$$\int\limits_K P(x, y) dx + Q(x, y) dy = \iint\limits_{A \tilde{a} B \tilde{e} A} P(x, y) dx + Q(x, y) dy = 0$$

bo'ldi. Integralning xossasidan foydalaniib ushbuni topamiz:

$$\begin{aligned} \int\limits_{A \tilde{a} B \tilde{e} A} P(x, y) dx + Q(x, y) dy &= \iint\limits_{AB} P(x, y) dx + Q(x, y) dy + \int\limits_{B \tilde{e} A} P(x, y) dx + Q(x, y) dy = \\ &= \int\limits_{A \tilde{a} B} P(x, y) dx + Q(x, y) dy - \int\limits_{A \tilde{e} B} P(x, y) dx + Q(x, y) dy \end{aligned}$$

Demak,

$$\int\limits_{A \tilde{a} B} P(x, y) dx + Q(x, y) dy - \iint\limits_{A \tilde{e} B} P(x, y) dx + Q(x, y) dy = 0$$

Bundan esa,

$$\int\limits_{A \times B} P(x, y) dx + Q(x, y) dy = \iint\limits_{A \times B} P(x, y) dx + Q(x, y) dy$$

ekanligi kelib chiqadi. ▶

**19.2-eslatma.** Yuqoridagi tasdiq, isbot jarayonidan ko'rindaniki,  $AB$  egri chiziq sodda egri chiziqlar to'plamidan ixtiyoriy olinganda o'rindilidir.

3) Agar ushbu

$$\int\limits_{AB} P(x, y) dx + Q(x, y) dy \quad (AB \subset (D)) \quad (18.33)$$

integral  $A$  va  $B$  nuqtalarni birlashtiruvchi egri chiziqlar bog'liq bo'lmasa, ya'ni integral integrallash yo'liga bog'liq bo'lmasa, u holda

$$P(x, y) dx + Q(x, y) dy$$

isoda  $(D)$  sohada berilgan biror funksiyaning to'liq differensiali bo'ladi.

◀ Modomiki, (19.33) integrallash yo'liga bog'liq emas ekan, u holda integral  $A = (x_0, y_0)$  va  $B = (x_1, y_1)$  nuqtalar bilan bir qiymatli aniqlanadi. Shuning uchun bu holda (19.33) integralni quyidagicha ham yozish mumkin:

$$\int\limits_{(x_0, y_0)}^{(x_1, y_1)} P(x, y) dx + Q(x, y) dy.$$

Endi  $A$  nuqtani tayinlab,  $B$  nuqta sifatida  $(D)$  sohaning ixtiyoriy  $(x, y)$  nuqtasini olib, ushhu

$$\int\limits_{(x_0, y_0)}^{(x, y)} P(x, y) dx + Q(x, y) dy$$

integralni qaraymiz. Ravshanki, bu integral  $(x, y)$  ga bog'liq bo'ladi:

$$F(x, y) = \int\limits_{(x_0, y_0)}^{(x, y)} P(x, y) dx + Q(x, y) dy.$$

Bu funksiyaning xususiy hisoblaymiz.  $(x, y)$  nuqtanining  $x$  koordinatasiga shunday  $\Delta x$  orttirma beraylikki,  $(x + \Delta x, y)$  nuqta va  $(x, y)$ ,  $(x + \Delta x, y)$  nuqtalarni birlashtiruvchi to'g'ri chiziq kesmasi ham  $(D)$  sohaga tegishli bo'lсин. Natijada  $f(x, y)$  funksiya ham xususiy orttirmaga ega bo'ladi:

$$\begin{aligned} F(x + \Delta x, y) - F(x, y) &= \int\limits_{(x_0, y_0)}^{(x + \Delta x, y)} P(x, y) dx + Q(x, y) dy - \int\limits_{(x_0, y_0)}^{(x, y)} P(x, y) dx + Q(x, y) dy = \\ &= \int\limits_{(x, y)}^{(x + \Delta x, y)} P(x, y) dx + Q(x, y) dy = \int\limits_{(x, y)}^{(x + \Delta x, y)} P(x, y) dx. \end{aligned}$$

O'rnai qiymat haqidagi teoremedan foydalanimiz quyidagini topamiz:

$$\int\limits_{(x, y)}^{(x + \Delta x, y)} P(x, y) dx = P(x + \theta \Delta x, y) \cdot \Delta x \quad (0 < \theta < 1).$$

Natijada

$$\frac{F(x + \Delta x, y) - F(x, y)}{\Delta x} = P(x + \theta \Delta x, y)$$

bo'ladi. Bundan

$$\lim_{\Delta x \rightarrow 0} \frac{F(x + \Delta x, y) - F(x, y)}{\Delta x} = \lim_{\Delta x \rightarrow 0} P(x + \theta \Delta x, y) = P(x, y)$$

bo'ladi. Demak,

$$\frac{\partial F(x, y)}{\partial x} = P(x, y).$$

Xuddi shunga o'xshash

$$\frac{\partial F(x, y)}{\partial y} = Q(x, y)$$

bo'lishi ko'rsatiladi.

Shunday qilib

$$P(x, y)dx + Q(x, y)dy = \frac{\partial F(x, y)}{\partial x} dx + \frac{\partial F(x, y)}{\partial y} dy = dF(x, y)$$

bo'ladi. ▶

4) Agar

$$P(x, y)dx + Q(x, y)dy \quad (18.34)$$

ifoda ( $D$ ) sohada berilgan biror funksiyaning to'liq differensiali bo'lsa, u holda

$$\frac{\partial P(x, y)}{\partial y} = \frac{\partial Q(x, y)}{\partial x}$$

bo'ladi.

◀ Aytaylik, (18.34) ifoda ( $D$ ) sohada berilgan  $F(x, y)$  funksiyaning to'liq differensiali bo'lsin:

$$P(x, y)dx + Q(x, y)dy = dF(x, y).$$

Ravshanki,

$$P(x, y) = \frac{\partial F(x, y)}{\partial x}, \quad Q(x, y) = \frac{\partial F(x, y)}{\partial y}.$$

Keyingi tengliklardan ushbuni topamiz:

$$\frac{\partial P(x, y)}{\partial y} = \frac{\partial^2 F(x, y)}{\partial y \partial x}, \quad \frac{\partial Q(x, y)}{\partial x} = \frac{\partial^2 F(x, y)}{\partial x \partial y}$$

Shartga ko'ra  $\frac{\partial P(x, y)}{\partial y}, \frac{\partial Q(x, y)}{\partial x}$  lar ( $D$ ) sohada uzlusiz. Aralash hosilalarning tengligi haqidagi teoremliga binoan (qaralsin, 13-bob, 6-§).

$$\frac{\partial P(x, y)}{\partial y} = \frac{\partial Q(x, y)}{\partial x}$$

bo'ladi. ▶

Shunday qilib, Grin formulasidan foydalangan holda, yuqoridagi 1)-4) tasdiqlar orasida

$$1) \Rightarrow 2) \Rightarrow 3) \Rightarrow 4) \Rightarrow 1)$$

munosabat borligi ko'rsatildi.

#### 4-§. Birinchi va ikkinchi tur egri chiziqli integrallar orasidagi bog'lanish

Tekislikda sodda silliq  $AB$  egri chiziq ushbu

$$\begin{aligned}x &= x(s) \\y &= y(s)\end{aligned} \quad (0 \leq s \leq S)$$

sistema bilan aniqlangan bo'lzin, bunda  $s$ - yoy uzunligi (qaralsin, ushbu bobning 1-§)  $x(s)$  va  $y(s)$  funksiyalar  $x'(s)$ ,  $y'(s)$  hosilalarga ega hamda bu hosilalar uzliksiz.

Ravshanki, bu egri chiziq har bir nuqtada urinmaga ega bo'ladi. Agar  $Ox$  va  $Oy$  o'qlar bilan urinmaning yoy o'sishi tomoniga qarab yo'nalish orasidagi burchak mos ravishda  $\alpha$  va  $\beta$  deyilsa, unda

$$x'(s) = \cos \alpha, \quad y'(s) = \cos \beta$$

bo'ladi.

Aytaylik, bu  $AB$  egri chiziqda  $f(x, y)$  funksiya berilgan va uzliksiz bo'lzin. U holda

$$\int_A^B f(x, y) dx$$

integral mavjud bo'ladi va (18.15) formulaga ko'tra

$$\int_A^B f(x, y) dx = \int_0^S f(x(s), y(s)) x'(s) ds$$

tenglik o'rinni. Bu tenglikning o'ng tomonidagi integralni quyidagicha

$$\int_0^S f(x(s), y(s)) x'(s) ds = \int_0^S f(x(s), y(s)) \cos \alpha ds$$

yozish mumkin. Ushbu bobning 1-§ da keltirilgan 1-teoremadan foydalanim quyidagini topamiz:

$$\int_0^S f(x(s), y(s)) \cos \alpha ds = \int_A^B f(x, y) \cos \alpha ds.$$

Natijada yuqoridaq tenglikdan

$$\int_A^B f(x, y) dx = \int_A^B f(x, y) \cos \alpha ds$$

bo'lishi kelib chiqadi.

Xuddi shunga o'xshash, tegishli shartda

$$\int_A^B f(x, y) dy = \int_A^B f(x, y) \cos \beta ds$$

va umumiy holda

$$\int_A^B P(x, y) dx + Q(x, y) dy = \int_A^B [P(x, y) \cos \alpha + Q(x, y) \cos \beta] ds$$

bo'ladi.

#### *Mashqilar*

##### **18.6. Ushbu**

$$J = \int_A^B (4\sqrt{x} - 3\sqrt{y}) ds$$

integral hisoblansin, bunda  $AB$  egri chiziq quyidagi

$$x = \cos^3 t, \quad y = \sin^3 t$$

astroidaning  $A(-1; 0)$  va  $B(0, 1)$  nuqtalari orasidagi qismi.

### 18.7. Ushbu

$$J = \int_{AB} x^2 ds$$

integral hisoblansin, bunda  $\bar{AB}$  egri chiziq quyidagi

$$x^2 + y^2 = a^2$$

aylanan yuqori qismi.

### 18.8. $AB$ yoyining uzunligi $l$ quyidagi

$$l = \int_{AB} ds$$

formula bilan topilishi isbotlansin.

Agar  $AB$  yoyi

$$\begin{aligned} x &= 2a \cos t - a \cos 2t, \\ y &= 2a \sin t - a \sin 2t \end{aligned}$$

kardiodadan iborat bo'lsa, uning uzunligi topilsin.

### 18.9. Tekislikda yopiq $C$ chiziq bilan chegaralangan ( $D$ ) shaklning yuzi

$$D = \frac{1}{2} \int_C x dy - y dx$$

bo'lishi isbotlansin.

Ushbu

$$x = a \cos t, \quad y = a \sin t$$

ellips bilan chegaralangan shaklning yuzi topilsin.

### 18.10. Agar material egri chiziq $AB$ ning zichligi $\rho = \rho(x, y)$ bo'lsa, uning massasi

$$m = \int_{AB} \rho(x, y) ds$$

bo'lishi isbotlansin.

Zichligi  $\rho(x, y) = \frac{y}{x}$  bo'lgan quyidagi

$$y = \frac{x^2}{2}$$

parabolaning  $\left(1, \frac{1}{2}\right)$   $(2, 2)$  nuqtalar orasidagi qismning massasi topilsin.

### Sirt integrallari

Mazkur kursning 17- bobida  $z = f(x, y)$  tenglama aniqlagan silliq ( $S$ ) sirt bilan tanishgan edik. Bunda  $z(x, y)$  funksiya ( $D$ ) sohada  $((D) \subset R^2)$  berilgan, uzlusiz va  $z'_x(x, y), z'_y(x, y)$  xususiy hosilalarga ega hamda bu hosilalar ham ( $D$ ) da uzlusiz funksiya edi. ( $S$ ) sirt yuzaga ega bo'lib, uning yuzi

$$S = \iint_D \sqrt{1 + z_x'^2(x, y) + z_y'^2(x, y)} dx dy \quad (19.1)$$

ga teng ekanligi ko'rsatildi.

O'sha bobning pirovardida  $R^3$  fazodagi ( $V$ ) sohada  $((V) \subset R^3)$  berilgan funksiyaning uch karrali integrali bilan tanishib, uni o'rgandik.

Endi  $R^3$  fazodagi ( $S$ ) sirda berilgan funksiyaning integrali tushunchasi bilan tanishamiz. Sirt integrali tushunchasini kiritishdan avval, bu erda ham funksiya berilish sohasining bo'laklashishi, bo'laklash ho'laklari, bo'laklashning diametri tushunchalari kiritilishi kerak.

Bu tushunchalar [ $a, b$ ] oraliqni bo'laklashi (qaralsin, 1-qism, 9-bob, 1-§) va tekislikda ( $D$ ) sohani bo'laklashi (qaralsin, 18-bob, 1-§) kabi kiritiladi va o'xshash xossalarga ega bo'ladi. Shuning uchun bu erda biz bu tushunchalarni kiritilgan hisoblab, bayonimizni bevosita sirt integralining ta'rifidan boshlab ketaveramiz.

#### 1-§. Birinchi tur sirt integrallari

**I. Birinchi tur sirt integralining ta'rifsi.**  $f(x, y, z)$  funksiya ( $S$ ) sirda  $((S) \subset R^3)$  berilgan bo'lsin. Bu sirtning  $P$  bo'laklashni va bu bo'laklashning har bir ( $S_k$ ) bo'lagida ( $k = 1, 2, \dots, n$ ) ixtiyoriy ( $\xi_k, \eta_k, \zeta_k$ ) nuqtani olaylik. Berilgan funksiyaning ( $\xi_k, \eta_k, \zeta_k$ ) nuqtadagi  $f(\xi_k, \eta_k, \zeta_k)$  qiymatini ( $S_k$ ) ning  $S_k$  yuziga ko'paytirib, quyidagi yig'indini tuzamiz:

$$\sigma = \sum_{k=1}^n f(\xi_k, \eta_k, \zeta_k) S_k$$

**I-ta'rif.** Ushbu

$$\sigma = \sum_{k=1}^n f(\xi_k, \eta_k, \zeta_k) S_k \quad (19.2)$$

yig'indi  $f(x, y, z)$  funksiyaning integral yig'indisi yoki Riman yig'indisi deb ataladi.

( $S$ ) sirtning shunday

$$P_1, P_2, \dots, P_n, \dots \quad (19.3)$$

bo'laklashlarini qaraymizki, ularning mos diametrlaridan tashkil topgan

$$\lambda_{P_1}, \lambda_{P_2}, \dots, \lambda_{P_n}, \dots$$

ketma-ketlik nolga intilsin:  $\lambda_p \rightarrow 0$ . Bunday  $P_m$  ( $m = 1, 2, \dots$ ) bo'laklashlarga nisbatan  $f(x, y, z)$  funksiyaning integral yig'indisini tuzamiz. Natijada ( $S$ ) sirtning (19.3) bo'laklashlariga mos integral yig'indilar qiymatlaridan iborat quyidagi ketma-ketlik hosil bo'ladi:

$$\sigma_1, \sigma_2, \dots, \sigma_m.$$

**2-ta'rif.** Agar ( $S$ ) sirtning har qanday (19.3) bo'laklashlari ketma-ketligi  $\{P_m\}$  olinganda ham, unga mos integral yig'indi qiymatlaridan iborat  $\{\sigma_m\}$  ketma-ketlik,  $(\xi_k, \eta_k, \zeta_k)$  nuqtalarni tanlab olinishga bog'liq bo'limgagan holda, hamma vaqt bitta  $J$  songa intilsa, bu  $J$  yig'indining limiti deb ataladi va u

$$\lim_{\lambda_p \rightarrow 0} \sigma = \lim_{\lambda_p \rightarrow 0} \sum_{k=1}^m f(\xi_k, \eta_k, \zeta_k) \cdot S_k = J \quad (19.4)$$

kabi belgilanadi.

Integral yig'indining limitini quyidagicha ham ta'riflash mumkin.

**3-ta'rif.** Agar  $\forall \varepsilon > 0$  olinganda ham, shunday  $\delta > 0$  topilsaki, ( $S$ ) sirtning diametri  $\lambda_p < \delta$  bo'lgan har qanday bo'laklashi hamda har bir ( $S_k$ ) bo'lakdan olingan ixtiyoriyi  $(\xi_k, \eta_k, \zeta_k)$  lar uchun

$$|\sigma - J| < \varepsilon$$

tengsizlik bajarilsa,  $J$  son  $\sigma$  yig'indining limiti deb ataladi va u (19.4) kabi belgilanadi.

**4-ta'rif.** Agar  $\lambda_p \rightarrow 0$  da  $f(x, y, z)$  funksiyaning integral yig'indisi  $\sigma$  chekli limitga ega bo'lsa,  $f(x, y, z)$  funksiya ( $S$ ) sirt bo'yicha integrallanuvchi (Riman ma'nosida integrallanuvchi) funksiya deb ataladi. Bu yig'indining chekli limiti  $J$  esa  $f(x, y, z)$  funksiyaning birinchi tur sirt integrali deyiladi va u

$$\iint_S f(x, y, z) ds$$

kabi belgilanadi. Demak,

$$\iint_S f(x, y, z) ds = \lim_{\lambda_p \rightarrow 0} \sigma = \lim_{\lambda_p \rightarrow 0} \sum_{k=1}^m f(\xi_k, \eta_k, \zeta_k) \cdot S_k$$

**2. Uzlusiz funksiya birinchi tur sirt integrali.** Endi birinchi tur sirt integralining mavjud bo'lishini ta'minlaydigan sharjni topish bilan shug'ullanamiz.

Faraz qilaylik  $R^3$  fazodagi ( $S$ ) sirt

$$z = z(x, y)$$

tenglama bilan berilgan bo'lsin. Bunda  $z = z(x, y)$  funksiya chegaralangan yopiq ( $D$ ) sohada ( $(D) \subset R^2$ ) uzlusiz va  $z_x'(x, y), z_y'(x, y)$  hosilalarga ega hamda bu hosilalar ham ( $D$ ) da uzlusiz.

**1-teorema.** Agar  $f(x, y, z)$  funksiya ( $S$ ) sirtida uzlusiz bo'lsa, u holda bu funksiyaning ( $S$ ) sirt bo'yicha birinchi tur sirt integrali

$$\iint_S f(x, y, z) ds$$

mavjud va

$$\iint_S f(x, y, z) ds = \iint_D f(x, y, z(x, y)) \sqrt{1 + z_x^2(x, y) + z_y^2(x, y)} dx dy$$

bo'ladi.

◀ ( $S$ ) sirtning  $P_S$  bo'laklashni olaylik. Uning bo'laklari ( $S_1$ ), ( $S_2$ ), ..., ( $S_n$ ) bo'lsin. Bu sirt va uning bo'laklarining  $Oxy$  tekislikdag'i proeksiyasi ( $D$ ) sohaning  $P_D$  bo'laklashni va uning ( $D_1$ ), ( $D_2$ ), ..., ( $D_n$ ) bo'laklarini hosil qiladi.  $P_S$  bo'laklashiga nisbatan (19.2) yig'indini tuzamiz:

$$\sigma = \sum_{k=1}^n f(\xi_k, \eta_k, \zeta_k) \cdot S_k$$

Ma'lumki,  $(\xi_k, \eta_k, \zeta_k) \in (S_k)$ . Bu nuqtaga akslanuvchi nuqta  $(\xi_k, \eta_k)$  bo'ladi. Demak,  $\zeta_k = z(\xi_k, \eta_k)$  (19.1) formulaga binoan

$$S_k = \iint_{(D_k)} \sqrt{1 + z_x^2(x, y) + z_y^2(x, y)} dx dy$$

bo'ladi.

O'rta qiymat haqidagi teorema (qaralsin, 17-bob. 5-§) dan foydalanib topamiz:

$$S_k = \sqrt{1 + z_x^2(\xi_k^*, \eta_k^*) + z_y^2(\xi_k^*, \eta_k^*)} \cdot D_k \quad ((\xi_k^*, \eta_k^*) \in (D_k)).$$

Natijada  $\sigma$  yig'indi quyidagi

$$\begin{aligned} \sigma &= \sum_{k=1}^n f(\xi_k, \eta_k, z(\xi_k, \eta_k)) S_k = \\ &= \sum_{k=1}^n f(\xi_k, \eta_k, z(\xi_k, \eta_k)) \sqrt{1 + z_x^2(\xi_k^*, \eta_k^*) + z_y^2(\xi_k^*, \eta_k^*)} \cdot D_k \end{aligned}$$

ko'rinishga keladi.

Endi  $\lambda_{P_S} \rightarrow 0$  da (bu holda  $\lambda_{P_D} \rightarrow 0$  ham nolga intiladi) yig'indining limitini topish maqsadida uning ifodasini o'zgartirib yozamiz:

$$\begin{aligned} \sigma &= \sum_{k=1}^n f(\xi_k, \eta_k, z(\xi_k, \eta_k)) \sqrt{1 + z_x^2(\xi_k^*, \eta_k^*) + z_y^2(\xi_k^*, \eta_k^*)} \cdot D_k + \\ &\quad + \sum_{k=1}^n f(\xi_k, \eta_k, z(\xi_k, \eta_k)) \left[ \sqrt{1 + z_x^2(\xi_k^*, \eta_k^*) + z_y^2(\xi_k^*, \eta_k^*)} - \right. \\ &\quad \left. - \sqrt{1 + z_x^2(\xi_k, \eta_k) + z_y^2(\xi_k, \eta_k)} \right] D_k \end{aligned} \quad (19.5)$$

Bu tenglikning o'ng tomonidagi ikkinchi qo'shiluvchini baholaymiz:

$$\begin{aligned} \left| \sum_{k=1}^n f(\xi_k, \eta_k, z(\xi_k, \eta_k)) \left[ \sqrt{1 + z_x^2(\xi_k^*, \eta_k^*) + z_y^2(\xi_k^*, \eta_k^*)} - \right. \right. \\ \left. \left. - \sqrt{1 + z_x^2(\xi_k, \eta_k) + z_y^2(\xi_k, \eta_k)} \right] D_k \right| < M \sum_{k=1}^n \left| \sqrt{1 + z_x^2(\xi_k^*, \eta_k^*) + z_y^2(\xi_k^*, \eta_k^*)} - \right. \\ \left. - \sqrt{1 + z_x^2(\xi_k, \eta_k) + z_y^2(\xi_k, \eta_k)} \right| D_k. \end{aligned}$$

bunda

$$M = \max|f(x, y, z)|$$

Ravshanki,

$$\sqrt{1 + z_x'^2(x, y) + z_y'^2(x, y)}$$

funksiya  $(D)$  da uzluksiz, demak, tekis uzluksiz. U holda Kantor teoremasining natijasiga ko'ra  $\forall \varepsilon > 0$  olinganda ham shunday  $\delta > 0$  topiladiki,  $(D)$  sohaning diametri  $\lambda_{P_D} < \delta$  bo'lgan har qanday  $P_D$  bo'laklashi uchun

$$\left| \sqrt{1 + z_x'^2(\xi_k, \eta_k)} + z_y'^2(\xi_k, \eta_k) - \sqrt{1 + z_x'^2(\xi_i, \eta_i)} + z_y'^2(\xi_i, \eta_i) \right| < \frac{\varepsilon}{MD}$$

bo'ladi. Unda

$$\left| \sum_{k=1}^n f(\xi_k, \eta_k) \cdot z(\xi_k, \eta_k) \right| \left| \sqrt{1 + z_x'^2(\xi_k, \eta_k)} + z_y'^2(\xi_k, \eta_k) - \sqrt{1 + z_x'^2(\xi_i, \eta_i)} + z_y'^2(\xi_i, \eta_i) \right| D_k < M \cdot \frac{\varepsilon}{MD} \sum_{k=1}^n D_k = \varepsilon$$

va demak,

$$\lim_{\lambda_{P_D} \rightarrow 0} \sum_{k=1}^n f(\xi_k, \eta_k) \cdot z(\xi_k, \eta_k) \left| \sqrt{1 + z_x'^2(\xi_k, \eta_k)} + z_y'^2(\xi_k, \eta_k) - \sqrt{1 + z_x'^2(\xi_i, \eta_i)} + z_y'^2(\xi_i, \eta_i) \right| D_k = 0$$

bo'ladi.

(19.5) tenglikning o'ng tomonidagi birinchi qo'shiluvchi

$$\sum_{k=1}^n f(\xi_k, \eta_k) \cdot z(\xi_k, \eta_k) \sqrt{1 + z_x'^2(\xi_k, \eta_k) + z_y'^2(\xi_k, \eta_k)} \cdot D_k$$

esa

$$f(x, y, z(x, y)) \sqrt{1 + z_x'^2(x, y) + z_y'^2(x, y)}$$

funksiyaning integral yig'indisidir. Bu funksiya  $(D)$  sohada uzluksiz. Demak,  $\lambda_{P_D} \rightarrow 0$  da integral yig'indi chekli limitga ega va

$$\begin{aligned} \lim_{\lambda_{P_D} \rightarrow 0} \sum_{k=1}^n f(\xi_k, \eta_k) \cdot z(\xi_k, \eta_k) \sqrt{1 + z_x'^2(\xi_k, \eta_k) + z_y'^2(\xi_k, \eta_k)} \cdot D_k &= \\ &= \iint_D f(x, y, z(x, y)) \sqrt{1 + z_x'^2(x, y) + z_y'^2(x, y)} dxdy \end{aligned}$$

bo'ladi. Bu munosabatni e'tiborga olib, (19.5) tenglikda  $\lambda_{P_D} \rightarrow 0$  da limitga o'tish topamiz:

$$\begin{aligned} \lim_{\lambda_{P_D} \rightarrow 0} \sigma &= \lim_{\lambda_{P_D} \rightarrow 0} \sum_{k=1}^n f(\xi_k, \eta_k) \cdot z(\xi_k, \eta_k) \sqrt{1 + z_x'^2(\xi_k, \eta_k) + z_y'^2(\xi_k, \eta_k)} \cdot D_k = \\ &= \iint_D f(x, y, z(x, y)) \sqrt{1 + z_x'^2(x, y) + z_y'^2(x, y)} dxdy. \end{aligned}$$

Demak,

$$\iint_S f(x, y, z) ds = \iint_D f(x, y, z(x, y)) \sqrt{1 + z_x'^2(x, y) + z_y'^2(x, y)} dxdy. \blacktriangleright$$

Bu teorema, bir tomonidan, uzlusiz funksiya bиринчи түр сирт интегралынин мавжудигини аниqlah bersa, иккичи томондан, bu integral иккি карралы Riman интегралы орқали ifodalанishini ko'rsatadi.

**I-eslatma** ( $S$ ) сирт  $x = x(y, z)$  ( $y = y(z, x)$ ) tenglama bilan аниqlangan bo'lib,  $x = x(y, z)$  funksiya ( $y(z, x)$  funksiya) ( $D$ ) sohada ( $(D) \subset R^2$ ) uzlusiz va  $x'_y(y, z)$ ,  $x'_z(y, z)$  xусусија hosilalarga ( $y'_z(z, x)$ ,  $y'_x(z, x)$  xусусија hosilalarga) ega hamda bu hosilalar ( $D$ ) da uzlusiz bo'lсин.

Agar  $f(x, y, z)$  funksiya shu ( $S$ ) сиртда uzlusiz bo'lsa, u holda hu funksiyaning биринчи түр сирт интеграли

$$\iint_S f(x, y, z) ds$$

mavjud va

$$\iint_S f(x, y, z) ds = \iint_D f(x(y, z), y, z) \sqrt{1 + x'^2(y, z) + x'^2_z(y, z)} dy dz,$$

$$\left( \iint_S f(x, y, z) ds = \iint_D f(x, y(z, x), z) \sqrt{1 + y'^2_x(z, x) + y'^2_z(z, x)} dz dx \right)$$

bo'ladi.

**2-eslatma.** Biz  $f(x, y, z)$  funksiya биринчи түр сирт интегралынин мавжудиги maxsus ko'rinishdagi ( $S$ ) сиртлар ( $z = z(x, y)$ ,  $x = x(y, z)$ ,  $y = y(z, x)$  tenglamalar bilan аниqlangan сиртлар) учун keltirdik. Aslida funksiya интегралынин мавжудиги keng sinfdagi сиртлар учун to'g'ri bo'ladi. Jumladan, agar ( $S$ ) сирт chekli sondagi yuqorida aytilgan сиртлар yig'indisi сифатида tasvirlangan bo'lsa, unda berilgan va uzlusiz bo'lgan  $f(x, y, z)$  funksiyaning сирт интегралы mavjud bo'ladi va u mos ikki karrali integrallar yig'indisiga teng bo'ladi.

**3. Birinchi tur sirt integrallarining xossalari.** Yuqorida keltirilgan teorema uzlusiz funksiyalar биринчи түр сирт интегралларининг иккি карралы Riman интегралларига kelishini ko'rsatadi. Binobarin, bu сирт integrallar ham ikki karrali Riman integrallari xossalari kabi xossalarga ega bo'ladi. Иккি карралы Riman integrallarining xossalari 17-bobning 5-§ ida o'rganilgan.

**4. Birinchi tur sirt integrallarni hisoblash.** Yuqorida keltirilgan teorema биринчи түр сирт интегралынин мавжудигини tasdiqlabgina qolmasdan, uni hisoblash yo'lini ham ko'rsatadi. Demak, биринчи түр сирт integrallar иккি карралы Riman integrallariga keltirilib hisoblanadi:

$$\iint_S f(x, y, z) ds = \iint_D f(x(y, z), y, z) \sqrt{1 + z'^2_x(x, y) + z'^2_y(x, y)} dx dy ,$$

$$\iint_S f(x, y, z) ds = \iint_D f(x(y, z), y, z) \sqrt{1 + x'^2_y(y, z) + x'^2_z(y, z)} dy dz , \quad (19.6)$$

$$\iint_S f(x, y, z) ds = \iint_D f(x, y(z, x), z) \sqrt{1 + y'^2_x(z, x) + y'^2_z(z, x)} dz dx$$

#### 19. I-misol. Ushbu

$$J = \iint_S (x + y + z) ds$$

integral hisoblansin.

Bunda  $(S) = x^2 + y^2 + z^2 = r^2$  sferaning  $z=0$  tekislikning yuqorisida joylashgan qismi.

◀ Ravshanki,  $(S)$  sirt

$$z = \sqrt{r^2 - x^2 - y^2}$$

tenglama bilan aniqlangan bo'lib, bu sirtda berilgan  $f(x, y, z) = x + y + z$  funksiya uzluksizdir. I-teorema ko'ra

$$J = \iiint_{(D)} \left( x + y + \sqrt{r^2 - x^2 - y^2} \right) \sqrt{1 + z_x'^2(x, y) + z_y'^2(x, y)} dx dy$$

bo'ladi, bunda  $(D) = \{(x, y) \in R^2 : x^2 + y^2 \leq r^2\}$ .

Endi bu tenglikning o'ng tomonidagi ikki karrali integralni hisoblaymiz:

$$z_x'(x, y) = -\frac{x}{\sqrt{r^2 - x^2 - y^2}}, \quad z_y'(x, y) = -\frac{y}{\sqrt{r^2 - x^2 - y^2}},$$

$$\sqrt{1 + z_x'^2(x, y) + z_y'^2(x, y)} = \frac{r}{\sqrt{r^2 - x^2 - y^2}}.$$

Demak,

$$\begin{aligned} J &= \iiint_{(D)} \left( x + y + \sqrt{r^2 - x^2 - y^2} \right) \sqrt{1 + z_x'^2(x, y) + z_y'^2(x, y)} dx dy = \\ &= r \iiint_{(D)} \left( \frac{x + y}{\sqrt{r^2 - x^2 - y^2}} + 1 \right) dx dy \end{aligned}$$

Keyingi integralda o'zgaruvchilarni almashtiramiz:

$$x = \rho \cos \varphi, \quad y = \rho \sin \varphi.$$

Natijada

$$\begin{aligned} J &= r \int_0^{2\pi} \left( \int_0^r \left( \frac{\rho(\cos \varphi + \sin \varphi)}{\sqrt{r^2 - \rho^2}} + 1 \right) \rho d\rho \right) d\varphi = r \int_0^{2\pi} \left( \int_0^r \frac{\rho(\cos \varphi + \sin \varphi)}{\sqrt{r^2 - \rho^2}} \rho d\rho \right) d\varphi + \\ &+ r \int_0^{2\pi} \left( \int_0^r \rho d\rho \right) d\varphi = r \int_0^{2\pi} (\cos \varphi + \sin \varphi) d\varphi \int_0^r \frac{\rho^2 d\rho}{\sqrt{r^2 - \rho^2}} + r \cdot 2\pi \cdot \frac{r^2}{2} = \pi r^3. \end{aligned}$$

Demak, berilgan integral

$$\iint_{(S)} (x + y + z) dS = \pi r^3$$

bo'ladi. ▶

**19.2-misol** Ushbu

$$\iint_{(S)} x(y + z) dS$$

integral hisoblansin, bunda  $(S) = x = \sqrt{a^2 - y^2}$  silindrik sirtning  $z=0, z=c$  ( $c > 0$ ) tekisliklar orasidagi qismi.

► Modomiki, bu  $(S)$  sirt  $x = \sqrt{a^2 - y^2}$  ko'rinishda berilgan ekan, unda integralni hisoblash uchun (19.6) formuladan foydalanish lozimdir.

$$\iint_S f(x, y, z) ds = \iint_D f(x(y, z), y, z) \sqrt{1 + x_y'^2(y, z) + x_z'^2(y, z)} dy dz.$$

Bunda  $(D)$  soha  $(S)$  sirtning  $Oyz$  tekislikdagi proeksiyasidan iborat:

$$(D) = \left\{ (y, z) \in R^2 : x = \sqrt{a^2 - y^2}, z = 0, z = c \right\} = \left\{ (y, z) \in R^2 : -a \leq y \leq a, 0 \leq z \leq c \right\}$$

$x = \sqrt{a^2 - y^2}$  funksiyaning xususiy hosilalari

$$x'_y(y, z) = -\frac{y}{\sqrt{a^2 - y^2}}, \quad x'_z(y, z) = 0$$

bo'ladi. Demak,

$$\iint_S f(x, y, z) ds = \iint_D \sqrt{a^2 - y^2} (y + z) \sqrt{1 + \frac{y^2}{a^2 - y^2}} dy dz = a \iint_D (y + z) dy dz$$

bo'ladi. Bu tenglikning o'ng tomonidagi ikki karrali integralni hisoblab topamiz:

$$\begin{aligned} a \iint_D (y + z) dy dz &= a \int_{-a}^a \left[ \int_0^z (y + z) dz \right] dy = a \int_{-a}^a \left[ yz + \frac{z^2}{2} \right]_{0}^{z=a} dy \\ &= a \int_{-a}^a \left[ cy + \frac{c^2}{2} \right] dy = \frac{ac}{2} y^2 \Big|_{-a}^a + \frac{ac^2}{2} y \Big|_{-a}^a = a^2 c^2 \end{aligned}$$

Demak,

$$\iint_S x(y + z) ds = a^2 c^2 \blacktriangleright$$

## 2-§. Ikkinch tur sirt integrallari

$R^3$  fazoda  $z = z(x, y)$  tenglama bilan aniqlangan  $(S)$  sirtni qaraylik. Bunda  $z(x, y)$  funksiya chegarasi bo'lakli-silliq chiziqdan iborat bo'lgan  $(D)$  sohada  $((D) \subset R^2)$  berilgan, uzlusiz,  $z'(x, y)$ ,  $z'_y(x, y)$  xususiy hosilalarga ega hamda bu hosilalar ham uzlusiz. Odatta bunday sirtni silliq sirt deyiladi. Silliq sirt har bir  $(x_0, y_0, z_0)$  nuqtasida urinma tekislikka ega bo'ladi.

Endi  $(S)$  sirt uning chegarasi bilan kesishmaydigan  $K$  yopiq chiziqni olaylik.  $(x_0, y_0, z_0)$  nuqta sirtning  $K$  yopiq chiziq bilan chegaralangan qismiga tegishli bo'lsin. Bu chiziqni  $Oxy$  tekisligiga proeksiyalaymiz. Natijada  $Oxy$  tekislikda ham  $K_n$  yopiq chiziq hosil bo'ladi. Mazkur kursning 18-bob, 2-§ ida tekislikdagi yopiq chiziqning mushbat va manfiy yo'nalishlari kiritilgan edi.  $(S)$  sirtdagи yopiq chiziqning mushbat va manfiy yo'nalishlari ham shu singari kiritiladi. Shuni ham aytish kerakki, yo'nalishning mushbat yoki manfiyligini aniqlash xarakatlanayotgan nuqtaga qay tomonidan qarashga ham bog'liq.

Sirning  $(x_0, y_0, z_0)$  nuqtasidagi urinma tekislikka shu nuqtada perpendikulyar o'tkazaylik. Bu perpendikulyarning musbat yo'nalishi deb shunday yo'nalish olamizki, uning tomonidan qaralganda ikkala ( $K$  hamda  $K_n$ ) yopiq chiziqlarning yo'nalishlari musbat bo'ladi. Uning manfiy yo'nalishi esa shunday yo'nalishki, u tomonidan qaralganda  $K_n$  ning musbat yo'nalishiga  $K$  ning manfiy yo'nalishi mos keladi. Perpendikulyarning musbat yo'nalishi bo'yicha olingan birlik kesma sirning  $(x_0, y_0, z_0)$  nuqtasidagi normali deyiladi.

Normalning  $Ox$ ,  $Oy$  va  $Oz$  o'qlarining musbat yo'nalishlari bilan tashkil qilgan burchaklarini mos ravishda  $\alpha, \beta, \gamma$  orqali belgilasak,

$$\cos \alpha = -\frac{z'_1}{\sqrt{1+z'_1^2+z'_2^2}}, \quad \cos \beta = -\frac{z'_2}{\sqrt{1+z'_1^2+z'_2^2}}, \quad \cos \gamma = \frac{1}{\sqrt{1+z'_1^2+z'_2^2}} \quad (19.7)$$

bo'ladi va ular normalning yo'naltiruvchi kosinuslari deyiladi.

Isbotlash mumkinki, silliq ( $S$ ) sirning barcha nuqtalaridagi perpendikulyarning musbat yo'nalishlari (normallari) bir xil bo'ladi. Va, demak, manfiy yo'nalishlari ham. Shunga ko'ra, sirning ikki tomoni haqida tushuncha kiritiladi.

Sirning ustki tomoni deb, uning shunday tomoni olinadiki, bu tomonidan qaralganda ikkala ( $K$  hamda  $K_n$ ) yopiq chiziqlarning yo'nalishlari musbat bo'ladi.

Sirning ustki tomoni qaralganda  $K_n$  bilan chegaralangan tekis shaklning yuzi musbat ishora bilan, pastki tomoni (ikkinci tomoni) qaralganda manfiy ishora bilan olinadi.

*1. Ikkinci tur sirt integralining ta'risi.*  $f(x, y, z)$  funksiya ( $S$ ) sirtda berilgan bo'lsin. Bu sirning ma'lum bir tomonini olaylik. Sirning  $P$  bo'laklashini va bu bo'laklashning har bir ( $S_k$ ) bo'lagida ( $k = 1, 2, \dots, n$ ) ixtiyoriy  $(\xi_k, \eta_k, \zeta_k)$  nuqta ( $k = 1, 2, \dots, n$ ) olaylik. Berilgan funksiyaning  $(\xi_k, \eta_k, \zeta_k)$  nuqtadagi  $f(\xi_k, \eta_k, \zeta_k)$  qiymatini ( $S_k$ ) ning  $Oxy$  tekislikdagi proeksiyasi ( $D_k$ ) ning yuziga ko'paytirib quyidagi yig'indini tuzamiz:

$$\sigma = \sum_{k=1}^n f(\xi_k, \eta_k, \zeta_k) P_k. \quad (19.8)$$

( $S$ ) sirning shunday

$$P_1, P_2, \dots, P_m. \quad (19.9)$$

bo'laklashlarini qaraymizki, ularning mos diametridan tashkil topgan

$$\lambda_{P_1}, \lambda_{P_2}, \dots, \lambda_{P_m}, \dots$$

ketma-ketlik nolga intilsin:  $\lambda_{P_m} \rightarrow 0$ . Bunday  $P_m$  ( $m = 1, 2, \dots$ ) bo'laklashlarga nisbatan  $f(x, y, z)$  funksiyaning integral yig'indilarini tuzamiz. Natijada ( $S$ ) sirning (19.9) bo'laklashlariga mos integrallar yig'indilar qiymatlaridan iborat quyidagi

$$\sigma_1, \sigma_2, \dots, \sigma_m, \dots$$

ketma-ketlik hosil bo'ladi.

**5-ta'rif.** Agar  $(S)$  sirtning har qanday ( $19.9$ ) bo'laklashlari ketma-ketligi  $\{P_m\}$  olinganda ham, unga mos integrallar yig'indilari qiymatlaridan iborat  $\{\sigma_m\}$  ketma-ketlik,  $(\xi_m, \eta_m, \zeta_m)$  nuqtalarni tanlab olinishiga bog'liq bo'limgan holda hamma vaqt bitta  $J$  songa intilsa, bu  $J$   $\sigma$  yig'indining limiti deb ataladi va u

$$\lim_{\lambda_p \rightarrow 0} \sigma = \lim_{\lambda_p \rightarrow 0} \sum_{k=1}^n f(\xi_k, \eta_k, \zeta_k) V_k = J \quad (19.10)$$

kabi belgilanadi.

Integral yig'indining limitini quyidagicha ham ta'riflash mumkin.

**6-ta'rif.** Agar  $\forall \varepsilon > 0$  olinganda ham, shunday  $\delta > 0$  topilsaki,  $(S)$  sirtning diametri  $\lambda_p < \delta$  bo'lgan har qanday  $P$  bo'laklashi hamda har bir  $(S_k)$  bo'lakdan olingan ixtiyoriy  $(\xi_k, \eta_k, \zeta_k)$  lar uchun

$$|\sigma - J| < \varepsilon$$

tengsizlik bajarilsa,  $J$  soni  $\sigma$  yig'indining limiti deb ataladi va u (19.10) kabi belgilanadi.

**7-ta'rif.** Agar  $\lambda_p \rightarrow 0$  da  $f(x, y, z)$  funksiyaning integral yig'indisi  $\sigma$  chekli limitga ega bo'lsa,  $f(x, y, z)$  funksiya  $(S)$  sirtning tanlangan tomon bo'yicha integrallanuvchi funksiya deb ataladi. Bu yig'indining chekli limiti  $J$  esa,  $f(x, y, z)$  funksiyaning  $(S)$  sirtning tanlangan tomoni bo'yicha ikkinchi tur sirt integrali deb ataladi va u

$$\iint_S f(x, y, z) dx dy$$

kabi belgilanadi. Demak,

$$\iint_S f(x, y, z) dx dy = \lim_{\lambda_p \rightarrow 0} \sigma = \lim_{\lambda_p \rightarrow 0} \sum_{k=1}^n f(\xi_k, \eta_k, \zeta_k) V_k.$$

Funksiya ikkinchi tur sirt integralining quyidagicha

$$\iint_S f(x, y, z) dx dy \quad (19.11)$$

belgilanishidan, integral  $(S)$  sirtning qaysi tomon bo'yicha olinganligi ko'rinxaydi. Binobarin, (19.11) integral to'g'risida gap borganda, har gal integral sirtning qaysi tomon bo'yicha olinayotganligi aytib boriladi.

Ravshanki,  $f(x, y, z)$  funksiyaning  $(S)$  sirtning bir tomoni bo'yicha olingan ikkinchi tur sirt integrali, funksiyaning shu sirtning ikkinchi tomoni bo'yicha olingan ikkinchi tur integralidan faqat ishorasi bilangina farq qiladi.

Yuqorida gidek

$$\iint_S f(x, y, z) dy dz, \quad \iint_S f(x, y, z) dz dx$$

ikkinchi tur sirt integrallari ta'riflanadi.

Shunday qilib, sirtda berilgan  $f(x, y, z)$  funksiyadan uchta -Oxy tekislikdagi proeksiyalar, Oyz tekislikdagi proeksiyalar hamda Ozx tekislikdagi proeksiyalar vositasida olingan ikkinchi tur sirt integrali tushunchalari kiritiladi.

Umumiy holda,  $(S)$  sirtida  $P(x, y, z)$ ,  $Q(x, y, z)$ ,  $R(x, y, z)$  funksiyalar berilgan bo'lib, ushbu

$$\iint\limits_{(S)} P(x, y, z) dx dy, \quad \iint\limits_{(S)} Q(x, y, z) dy dz, \quad \iint\limits_{(S)} R(x, y, z) dz dx$$

integrallar mavjud bo'lsa, u holda

$$\iint\limits_{(S)} P(x, y, z) dx dy + \iint\limits_{(S)} Q(x, y, z) dy dz + \iint\limits_{(S)} R(x, y, z) dz dx$$

yig'indi ikkinchi tur sirt integralining umumiy ko'rinishi deb ataladi va u

$$\iint\limits_{(S)} P(x, y, z) dx dy + Q(x, y, z) dy dz + R(x, y, z) dz dx$$

kabi belgilanadi. Demak,

$$\begin{aligned} & \iint\limits_{(S)} P(x, y, z) dx dy + \iint\limits_{(S)} Q(x, y, z) dy dz + \iint\limits_{(S)} R(x, y, z) dz dx = \\ & = \iint\limits_{(S)} P(x, y, z) dx dy + Q(x, y, z) dy dz + R(x, y, z) dz dx. \end{aligned}$$

Endi  $R'$  fazoda biror  $(V')$  jism berilgan bo'lsin. Bu qismni o'rab turgan yopiq sirt silliq sirt bo'lib, uni  $(S)$  deylik.  $f(x, y, z)$  funksiya  $(V')$  da berilgan. O'y tekislikka parallel bo'lgan tekislik bilan  $(V')$  ni ikki qismga ajratamiz:  $(V') = (V_1) + (V_2)$ . Natijada uni o'rab turgan  $(S)$  sirt ham  $(S_1)$  va  $(S_2)$  sirlarga ajraladi. Ushbu

$$\iint\limits_{(S_1)} f(x, y, z) dx dy + \iint\limits_{(S_2)} f(x, y, z) dx dy \quad (19.12)$$

integral (agar u mavjud bo'lsa)  $f(x, y, z)$  funksiyaning yopiq sirt bo'yicha ikkinchi tur sirt integrali deb ataladi va

$$\iint\limits_{(S)} f(x, y, z) dx dy$$

kabi belgilanadi. Bunda (19.12) munosabatdagi birinchi integral  $(S_1)$  sirtning ustki tomoni, ikkinchi integral esa  $(S_2)$  sirtning pastki tomoni bo'yicha olingan. Xuddi shunga o'xshash

$$\iint\limits_{(S)} f(x, y, z) dy dz, \quad \iint\limits_{(S)} f(x, y, z) dz dx$$

hamda, umumiy holda

$$\iint\limits_{(S)} P(x, y, z) dx dy + Q(x, y, z) dy dz + R(x, y, z) dz dx$$

integrallar ta'riflanadi.

**2. Uzlusiz funksiya ikkinchi tur sirt integrali.** Faraz qilaylik,  $R^1$  fazoda  $(S)$  sirt  $z = z(x, y)$  tenglama bilan berilgan bo'lsin. Bunda  $z = z(x, y)$  funksiya chegaralangan yopiq  $(D)$  sohada  $((D) \subset R^2)$  uzlusiz va  $z'_x(x, y)$ ,  $z'_y(x, y)$  xususiy hosilalarga ega hamda bu hosilalar ham  $(D)$  da uzlusiz.

**2-teorema.** Agar  $f(x, y, z)$  funksiya  $(S)$  sirtida uzlusiz bo'lsa, u holda bu funksiyaning  $(S)$  sirt bo'yicha olingan ikkinchi tur sirt integrali

$$\iint\limits_{(S)} f(x, y, z) dx dy$$

mavjud va

$$\iint\limits_{(S)} f(x, y, z) dx dy = \iint\limits_{(D)} f(x, y, z(x, y)) dx dy$$

bo'ladi.

◀ (S) sirtning  $P_S$  bo'laklashini olaylik. Uning bo'laklari  $(S_1), (S_2), \dots, (S_n)$  bo'lsin. Bu sirt va uning bo'laklarining  $Oxy$  tekislikdagi proeksiyasi  $(D)$  ning  $P_D$  bo'laklashini va uning  $(D_1), (D_2), \dots, (D_n)$  bo'laklarini hosil qiladi.  $P_S$  bo'laklashga nisbatan ushbu yig'indini tuzamiz:

$$\sigma = \sum_{k=1}^n f(\xi_k, \eta_k, \zeta_k) D_k. \quad (19.8)$$

Agar (S) sirtning ustki tomoni qaratayotgan bo'lsa, u holda barcha  $D_k$  lar mushbat bo'ladi.

Modomiki,  $f(x, y, z)$  funksiya  $z = z(x, y)$  sirda berilgan ekan, u  $x$  va  $y$  o'zgaruvchilarning quyidagi funksiyasiga aylanadi:

$$f(x, y, z) = f(x, y, z(x, y)).$$

Bundan esa

$$\zeta_k = z(\xi_k, \eta_k) \quad (k = 1, 2, \dots, n)$$

bo'lishi kelib chiqadi. Natijada (19.8) yig'indi ushbu

$$\sigma = \sum_{k=1}^n f(\xi_k, \eta_k, z(\xi_k, \eta_k)) D_k$$

ko'rinishga keladi. Bu yig'indi  $f(x, y, z(x, y))$  funksiyaning integral yig'indisi (ikki karrali integral uchun integral yig'indi) ekanini payqash qiyin emas. Agar  $f(x, y, z(x, y))$  funksiyaning  $(D)$  da uzlusiz ekanligini e'tiborga olsak, unda  $\lambda_{P_n} \rightarrow 0$  da

$$\sum_{k=1}^n f(\xi_k, \eta_k, z(\xi_k, \eta_k)) D_k$$

yig'indi chekli limitga ega va

$$\lim_{\lambda_{P_n} \rightarrow 0} \sum_{k=1}^n f(\xi_k, \eta_k, z(\xi_k, \eta_k)) D_k = \iint\limits_{(D)} f(x, y, z(x, y)) dx dy$$

bo'ladi. Demak,

$$\begin{aligned} \lim_{\lambda_{P_n} \rightarrow 0} \sigma &= \lim_{\lambda_{P_n} \rightarrow 0} \sum_{k=1}^n f(\xi_k, \eta_k, \zeta_k) D_k = \\ &= \lim_{\lambda_{P_n} \rightarrow 0} \sum_{k=1}^n f(\xi_k, \eta_k, z(\xi_k, \eta_k)) D_k = \iint\limits_{(D)} f(x, y, z(x, y)) dx dy. \end{aligned}$$

Bundan esa

$$\iint\limits_{(S)} f(x, y, z) dx dy = \iint\limits_{(D)} f(x, y, z(x, y)) dx dy$$

bo'lishi kelib chiqadi. ▶

Agar  $(S)$  sirtning pastki tomoni qaralsa, unda  $D_1$  lar manfiy bo'lib,

$$\iint\limits_{(S)} f(x, y, z) dx dy = - \iint\limits_{(D)} f(x, y, z(x, y)) dx dy$$

bo'ladi.

Xuddi yuqoridagidek, tegishli shartlarda

$$\iint\limits_{(S)} f(x, y, z) dy dz, \quad \iint\limits_{(S)} f(x, y, z) dz dx$$

integrallar mavjud va

$$\iint\limits_{(S)} f(x, y, z) dy dz = \iint\limits_{(D)} f(x(y, z), y, z) dy dz,$$

$$\iint\limits_{(S)} f(x, y, z) dz dx = \iint\limits_{(D)} f(x, y(x, z), z) dz dx$$

bo'ladi.

*I-natija.* Yasovchilari  $Oz$  o'qiga parallel bo'lgan  $(S)$  silindrik sirtni qaraylik.  $f(x, y, z)$  funksiya shu sirda berilgan bo'lsin. U holda

$$\iint\limits_{(S)} f(x, y, z) dx dy$$

mavjud bo'ladi va u nolga teng:

$$\iint\limits_{(S)} f(x, y, z) dx dy = 0.$$

Xuddi shunga o'xshash, tegishli shartlarda

$$\iint\limits_{(S)} f(x, y, z) dy dz = 0, \quad \iint\limits_{(S)} f(x, y, z) dz dx = 0$$

bo'ladi.

Bu tengliklari bevosita ikkinchi tur sirt integrallari ta'rifidan kelib chiqadi.

Yuqorida keltirilgan teoremadan foydalanib, ikkinchi tur sirt integrallari ham ikki karrali Riman integrallari xossalari kabi xossalarga ega bo'lishini ko'rsatish va ularni keltirib chiqarishni o'quvchiga havola etamiz.

*3. Ikkinci tur sirt integrallarini hisoblash.* Yuqorida keltirilgan teoremadan foydalanib ikkinchi tur sirt integrallari ikki karrali Riman integrallariga keltirib hisoblanadi:

$$\iint\limits_{(S)} f(x, y, z) dx dy = \iint\limits_{(D)} f(x, y, z(x, y)) dx dy,$$

$$\iint\limits_{(S)} f(x, y, z) dy dz = \iint\limits_{(D)} f(x(y, z), y, z) dy dz,$$

$$\iint\limits_{(S)} f(x, y, z) dz dx = \iint\limits_{(D)} f(x, y(z, x), z) dz dx.$$

*19.3-misol.* Ushbu

$$\iint\limits_{(S)} \left( \frac{x^2}{a^2} + \frac{y^2}{b^2} + kz \right) dx dy$$

integral hisoblansin. Bunda  $(S) - \frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1$  ellipsoidning  $z = 0$  tekislikdan pastda joylashgan qism bo'lib, integral shu sirtning pastki tomon bo'yicha olingan.

◀ Ravshanki. hu ( $S$ ) sirtning tenglamasi quyidagicha bo'lib.

$$z = -c \sqrt{1 - \frac{x^2}{a^2} - \frac{y^2}{b^2}}$$

uning  $Oxy$  tekislikdagi proeksiyasi

$$(D) = \left\{ (x, y) \in R^2 : \frac{x^2}{a^2} + \frac{y^2}{b^2} \leq 1 \right\}$$

bo'ladi.

( $S$ ) sirt ham, bu sirtda berilgan

$$f(x, y, z) = \frac{x^2}{a^2} + \frac{y^2}{b^2} + kz$$

funksiya ham 2-teormaning shartlarini qanoatlanadiradi. U holda

$$\iiint_D \left( \frac{x^2}{a^2} + \frac{y^2}{b^2} + kz \right) dx dy = - \iint_D \left( \frac{x^2}{a^2} + \frac{y^2}{b^2} - kc \sqrt{1 - \frac{x^2}{a^2} - \frac{y^2}{b^2}} \right) dx dy$$

bo'ladi. Integral ( $S$ ) sirtning pastki tomoni bo'yicha olinganligi sababli tenglikning o'ng tomonidagi ikki karrali integral oldiga minus ishorasi qo'yildi.

Endi bu

$$- \iint_D \left( \frac{x^2}{a^2} + \frac{y^2}{b^2} - kc \sqrt{1 - \frac{x^2}{a^2} - \frac{y^2}{b^2}} \right) dx dy = \iint_D \left[ kc \sqrt{1 - \frac{x^2}{a^2} - \frac{y^2}{b^2}} - \frac{x^2}{a^2} - \frac{y^2}{b^2} \right] dx dy$$

ikki karrali integralni hisoblaymiz. Ikki karrali integralda o'zgaruvchilarni

$$x = a\rho \cos \varphi, \quad y = b\rho \sin \varphi$$

kabi almashtirib quyidagini topamiz:

$$\begin{aligned} & \iint_D \left[ kc \sqrt{1 - \frac{x^2}{a^2} - \frac{y^2}{b^2}} - \frac{x^2}{a^2} - \frac{y^2}{b^2} \right] dx dy = \int_0^{2\pi} \left[ \int_0^a \left[ kc \sqrt{1 - \rho^2} - \rho^2 \right] ab \rho d\rho \right] d\varphi = \\ & = ab \int_0^{2\pi} \left[ \int_0^a \left( kc \rho \sqrt{1 - \rho^2} - \rho^2 \right) d\rho \right] d\varphi = 2\pi ab \left[ -\frac{kc}{2} \frac{(1 - \rho^2)^{\frac{3}{2}}}{3} - \frac{\rho^4}{4} \right]_0^a = 2\pi ab \left( -\frac{1}{4} + \frac{kc}{3} \right). \end{aligned}$$

Demak,

$$\iint_S \left( \frac{x^2}{a^2} + \frac{y^2}{b^2} + kz \right) dx dy = 2\pi ab \left( \frac{kc}{3} - \frac{1}{4} \right).$$

**4. Birinchi va ikkinchi tur sirt integrallari orasida bog'lanish.** Biz 18-hobning 4-§ da birinchi va ikkinchi tur egi chiziqli integrallar orasidaga bog'lanishni ifodalaydigan formulalarni keltirgan edik.

Shunga o'xshash, birinchi va ikkinchi tur sirt integrallari orasidagi bog'lanishni ifodalovchi formulalar ham mavjud.

( $S$ ) sirt va unda berilgan  $f(x, y, z)$  va  $P(x, y, z)$ ,  $Q(x, y, z)$ ,  $R(x, y, z)$  funksiyalar tegishli shartlarni qanoatlanirganda (qaralsin, 2-§ning 1-punkti) ushbu

$$\iint_S f(x, y, z) dy dz = \iint_S f(x, y, z) \cos adx,$$

$$\iint\limits_{(S)} f(x, y, z) dz dx = \iint\limits_{(S)} f(x, y, z) \cos \beta ds, \quad (19.13)$$

$$\iint\limits_{(S)} f(x, y, z) dy dz = \iint\limits_{(S)} f(x, y, z) \cos \gamma ds$$

umumiy holda

$$\iint\limits_{(S)} P(x, y, z) dy dz + Q(x, y, z) dz dx + R(x, y, z) dx dy =$$

$$= \iint\limits_{(S)} [P(x, y, z) \cos \alpha + Q(x, y, z) \cos \beta + R(x, y, z) \cos \gamma] ds$$

formulalarning to'g'riligini isbotlashni o'quvchiga havola etamiz.

### 3-§. Stoks formulasi

$R'$  fazoda  $z = z(x, y)$  tenglama bilan aniqlangan silliq  $(S)$  sirt berilgan bo'lzin. Bu sirtning chegarasi  $\partial S$  bo'lakli-silliq egri chiziq bo'lzin.  $(S)$  sirtning  $Oxy$  tekislikdagi proeksiyasini  $(D)$  deylik. Unda  $\partial S$  ning proeksiysi  $\partial D$  dan iborat bo'ladi.

Faraz qilaylik,  $(S)$  sirtda  $P(x, y, z)$  funksiya berilgan bo'lib, u uzuksiz bo'lzin. Undan tashqari bu funksiya  $(S)$  da

$$\frac{\partial P(x, y, z)}{\partial x}, \frac{\partial P(x, y, z)}{\partial y}, \frac{\partial P(x, y, z)}{\partial z}$$

xususiy hosilalarga ega va ular uzuksiz bo'lzin.

Ushbu

$$\int\limits_{\partial S} P(x, y, z) dx$$

egri chiziqli integralni qaraylik (uning mavjudligi ravshan). Agar  $\partial S$  chiziqning  $(S)$  sirtda yotishini e'tiborga olsak, u holda

$$\int\limits_{\partial S} P(x, y, z) dx = \int\limits_{\partial S} P(x, y, z(x, y)) dx$$

bo'ladi.

Endi Grin formulasidan foydalanim ushbuni topamiz:

$$\int\limits_{\partial S} P(x, y, z(x, y)) dx = - \iint\limits_{(D)} \frac{\partial P(x, y, z(x, y))}{\partial y} dxdy$$

Ravshanki,  $P(x, y, z(x, y))$  funksiyaning  $y$  o'zgaruvchi bo'yicha xususiy hosilasi

$$\frac{\partial P(x, y, z(x, y))}{\partial y} + \frac{\partial P(x, y, z(x, y))}{\partial z} \cdot z'_y(x, y)$$

bo'ladi.

Ushbu bobning 2-§ idagi (19.7) munosabatlardan

$$z'_y(x, y) = - \frac{\cos \beta}{\cos \gamma}$$

bo'lishini e'tiborga olsak.

$$\begin{aligned}
 & \iiint_{(V)} \left| \frac{\partial P(x, y, z(x, y))}{\partial y} + \frac{\partial P(x, y, z(x, y))}{\partial z} \right| dz(x, y) dx dy = \\
 & = \iint_{(S)} \left| \frac{\partial P(x, y, z(x, y))}{\partial y} - \frac{\partial P(x, y, z(x, y))}{\partial z} \right| \frac{\cos \beta}{\cos \gamma} dx dy
 \end{aligned}$$

bo'ladi.

Natijada qaralayotgan integral uchun quyidagi tenglikka ega bo'lamiz:

$$\int_{\Omega} P(x, y, z) dx = - \iint_{(S)} \left| \frac{\partial P(x, y, z(x, y))}{\partial y} - \frac{\partial P(x, y, z(x, y))}{\partial z} \right| \frac{\cos \beta}{\cos \gamma} dx dy \quad (19.14)$$

2-§ dagi 2-teoremadan foydalanim (19.14) tenglikning o'ng tomonidagi ikki karrali integralni ikkinchi tur sirt integrali orqali ifodalaymiz:

$$\begin{aligned}
 & \iint_{(V)} \left| \frac{\partial P(x, y, z(x, y))}{\partial y} - \frac{\partial P(x, y, z(x, y))}{\partial z} \right| \frac{\cos \beta}{\cos \gamma} dx dy = \\
 & = \iint_{(S)} \left| \frac{\partial P(x, y, z)}{\partial y} - \frac{\partial P(x, y, z)}{\partial z} \right| \frac{\cos \beta}{\cos \gamma} dx dy.
 \end{aligned}$$

Bu tenglikning o'ng tomonidagi ikkinchi tur sirt integralini, (19.13) formulaga asoslanib, birinchi tur sirt integraliga keltiramiz:

$$\begin{aligned}
 & \iint_{(S)} \left| \frac{\partial P(x, y, z)}{\partial y} - \frac{\partial P(x, y, z)}{\partial z} \right| \frac{\cos \beta}{\cos \gamma} dx dy = \\
 & = \iint_{(S)} \left| \frac{\partial P(x, y, z)}{\partial y} - \frac{\partial P(x, y, z)}{\partial z} \right| \frac{\cos \beta}{\cos \gamma} \cos \gamma ds = \\
 & = \iint_{(S)} \frac{\partial P(x, y, z)}{\partial y} \cos \gamma ds - \iint_{(S)} \frac{\partial P(x, y, z)}{\partial z} \cos \beta ds.
 \end{aligned} \quad (19.15)$$

Va nihoyat, yana (19.13) formulalardan foydalanim quyidagini topamiz:

$$\begin{aligned}
 & \iint_{(S)} \frac{\partial P(x, y, z)}{\partial y} \cos \gamma ds = \iint_{(S)} \frac{\partial P(x, y, z)}{\partial y} dx dy. \\
 & \iint_{(S)} \frac{\partial P(x, y, z)}{\partial z} \cos \beta ds = \iint_{(S)} \frac{\partial P(x, y, z)}{\partial z} dz dx
 \end{aligned} \quad (19.16)$$

(19.14), (19.15) va (19.16) munosabatlardan

$$\int_{\Omega} P(x, y, z) dx = \iint_{(S)} \frac{\partial P(x, y, z)}{\partial z} dz dx - \iint_{(S)} \frac{\partial P(x, y, z)}{\partial y} dx dy \quad (19.17)$$

bo'lishi kelib chiqadi.

Xuddi shunday mulohaza asosida ( $S$ ) sirt va unda berilgan  $Q(x, y, z)$ ,  $R(x, y, z)$  funksiyalar tegishli shartlarni bajarganda ushbu

$$\begin{aligned}
 & \int_{\Omega} Q(x, y, z) dy = \iint_{(S)} \frac{\partial Q(x, y, z)}{\partial x} dx dy - \frac{\partial Q(x, y, z)}{\partial z} dy dz. \\
 & \int_{\Omega} R(x, y, z) dz = \iint_{(S)} \frac{\partial R(x, y, z)}{\partial y} dy dz - \frac{\partial R(x, y, z)}{\partial x} dz dx
 \end{aligned} \quad (19.18)$$

formulalarning o'rinni bo'lishi ko'rsatiladi. (19.17) va (19.18) formulalarni hadlab qo'shib quyidagini topamiz:

$$\begin{aligned} & \int P(x, y, z) dx + Q(x, y, z) dy + R(x, y, z) dz = \\ & = \iint_S \left[ \frac{\partial Q(x, y, z)}{\partial x} - \frac{\partial P(x, y, z)}{\partial y} \right] dx dy + \left[ \frac{\partial R(x, y, z)}{\partial y} - \frac{\partial P(x, y, z)}{\partial z} \right] dy dz + \left[ \frac{\partial Q(x, y, z)}{\partial z} - \frac{\partial R(x, y, z)}{\partial x} \right] dz dx. \end{aligned} \quad (19.19)$$

Bu Stoks formulasi deb ataladi.

**2-natija.** Mazkur kursning 18-bob, 3-§ idagi Grin formulasi Stoks formulasi ning xususiy holdir. Haqiqatdan ham (19.19) Stoks formulasyida ( $S$ ) sirt sifatida  $Oxy$  tekislikdagi ( $D$ ) soha olinsa, unda  $z = 0$  bo'lib, (19.19) formuladan

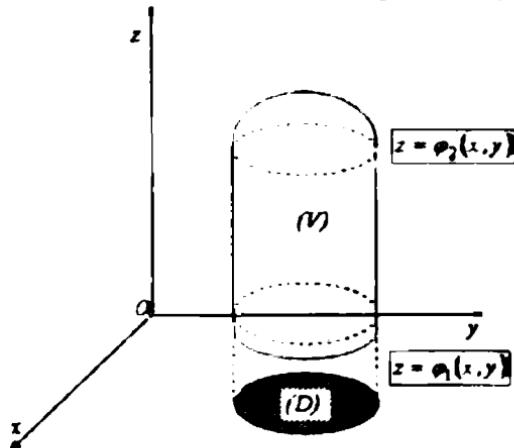

$$\int P(x, y) dx + Q(x, y) dy = \iint_D \left[ \frac{\partial Q(x, y)}{\partial x} - \frac{\partial P(x, y)}{\partial y} \right] dx dy$$

bo'lishi kelib chiqadi. Bu Grin formulasyidir.

Shunday qilib, Stoks formulasi ( $S$ ) sirt bo'yicha olingan II-tur sirt integrali bilan shu sirtning chegarasi bo'yicha olingan egri chiziqli integralni bog'lovchi formuladir.

#### 4-§. Ostrogradskiy formulasi

$R^3$  fazoda pastdan  $z = \varphi_1(x, y)$  tenglama bilan aniqlangan silliq ( $S_1$ ) sirt bilan, yuqoridan  $z = \varphi_2(x, y)$  tenglama yordamida aniqlangan silliq ( $S_2$ ) sirt bilan, yon tomonidan esa yasovchilar O $z$  o'qiga parallel bo'lgan silindrik ( $S_3$ ) sirt bilan chegaralangan ( $I'$ ) sohani (jismni) qaraylik. Uning  $Oxy$  tekislikdagi proeksiyasi ( $D$ ) bo'lib, bu ( $D$ ) ning chegarasi yuqorida aytilgan silindrik sirtning yo'naltiruvchisi sifatida olinadi. ( $\varphi_1(x, y) < \varphi_2(x, y)$  ( $x, y \in D$ )) (64-chizma).

64-chizma

Faraz qilaylik, ( $V$ ) da  $R(x, y, z)$  funksiya berilgan va uzluksiz bo'lsin. Bundan tashqari bu funksiya shu sohada

$$\frac{\partial R(x, y, z)}{\partial z}$$

xususiy hosilaga ega va bu hosila ham uzluksiz.

Ravshanki, bu holda

$$\iiint_V \frac{\partial R(x, y, z)}{\partial z} dx dy dz$$

majud bo'ladi va 17-bohnning 10-§ ida keltirilgan formulaga ko'tra

$$\iiint_V \frac{\partial R(x, y, z)}{\partial z} dx dy dz = \iint_{D_{\phi_2}(x, y)} \left[ \int_{\phi_1(x, y)}^{\phi_2(x, y)} \frac{\partial R(x, y, z)}{\partial z} dz \right] dx dy \quad (19.20)$$

bo'ladi.

Agar

$$\int_{\phi_1(x, y)}^{\phi_2(x, y)} \frac{\partial R(x, y, z)}{\partial z} dz = R(x, y, \phi_2(x, y)) - R(x, y, \phi_1(x, y))$$

bo'lishini e'tiborga olsak, u holda

$$\iint_{D_{\phi_2}(x, y)} \left[ \int_{\phi_1(x, y)}^{\phi_2(x, y)} \frac{\partial R(x, y, z)}{\partial z} dz \right] dx dy = \iint_D R(x, y, \phi_2(x, y)) dx dy - \iint_D R(x, y, \phi_1(x, y)) dx dy \quad (19.21)$$

bo'ladi. Bu tenglikning o'ng tomonidagi ikki karrali integrallarni 2-§ dagi formulalardan foydalanib, sirt integrallari orqali yozamiz:

$$\iint_D R(x, y, \phi_2(x, y)) dx dy = \iint_{S_1} R(x, y, z) dx dy. \quad (19.22)$$

$$\iint_D R(x, y, \phi_1(x, y)) dx dy = \iint_{S_2} R(x, y, z) dx dy. \quad (19.22)$$

Keltirilgan tengliklardagi sirt integrallari sirting ustki tomoni bo'yicha olingan (19.20), (19.21) va (19.22) munosabatlardan quyidagini topamiz:

$$\iiint_V \frac{\partial R(x, y, z)}{\partial z} dx dy dz = \iint_{S_1} R(x, y, z) dx dy + \iint_{S_2} R(x, y, z) dx dy. \quad (19.23)$$

Bu tenglikning o'ng tomonidagi ikkinchi integral ( $S_1$ ) sirting pastki tomoni bo'yicha olingan.

( $S_1$ ) sirt yasovchilar O<sub>z</sub> o'qiga parallel bo'lgan silindrik sirt bo'lganligidan

$$\iint_{S_1} R(x, y, z) dx dy = 0 \quad (19.24)$$

bo'ladi. (19.23) va (19.24) munosabatlardan

$$\begin{aligned} \iiint_V \frac{\partial R(x, y, z)}{\partial z} dx dy dz &= \iint_{S_1} R(x, y, z) dx dy + \iint_{S_2} R(x, y, z) dx dy + \\ &+ \iint_{S_3} R(x, y, z) dx dy = \iint_S R(x, y, z) dx dy \end{aligned}$$

bo'lishi kelib chiqadi. Bunda ( $S$ ) – ( $V$ ) jismni o'rab turuvchi sirt.

Demak,

$$\iiint_V \frac{\partial R(x, y, z)}{\partial z} dx dy dz = \iint_S R(x, y, z) dx dy \quad (19.25)$$

Xuddi shu yo'l bilan,  $(V)$  hamda  $P(x, y, z)$ ,  $Q(x, y, z)$  lar tegishli shartlarni qanoatlantirganda quyidagi

$$\iiint_V \frac{\partial P(x, y, z)}{\partial x} dx dy dz = \iint_S P(x, y, z) dy dz, \quad (19.26)$$

$$\iiint_V \frac{\partial Q(x, y, z)}{\partial y} dx dy dz = \iint_S Q(x, y, z) dz dx \quad (19.27)$$

formulalarning to'g'riligi isbotlanadi.

Yuqoridagi (19.25), (19.26) va (19.27) tengliklarni hadlab qo'shib quyidagi-larni topamiz:

$$\begin{aligned} \iiint_V \left( \frac{\partial P(x, y, z)}{\partial x} + \frac{\partial Q(x, y, z)}{\partial y} + \frac{\partial R(x, y, z)}{\partial z} \right) dx dy dz &= \\ &= \iint_S P(x, y, z) dy dz + Q(x, y, z) dz dx + R(x, y, z) dx dy. \end{aligned}$$

Bu formula Ostrogradskiy formulasi deb ataladi.

### Mashqlar

#### 19.4. Ushbu

$$\iint_S \left( y + z + \sqrt{a^2 + x^2} \right) ds$$

integral hisoblansin, bunda  $(S)$  sirt quyidagi

$$x = a^2 - y^2 - z^2$$

paraboloidning  $Oyz$  tekisligi bilan kesishishidan hosil bo'lgan sirtning tashqi qismi.

#### 19.5. Sirtning yuzi

$$S = \iint_S ds$$

formula bilan topilishi isbotlansin.

Ushbu

$$x^2 + y^2 = R \cdot x$$

silindrning

$$x^2 + y^2 + z^2 = R^2$$

sfera ichida joylashgan qismining yuzi topilsin.

### Furye qatorlari

Biz yuqorida, kursimiz davomida, murakkab funksiyalarni ulardan soddaroq bo'lgan funksiyalar orqali ifodalash masalalariga bir necha marta duch keldik va ularni o'rgandik. Bu sohadagi klassik masalalardan biri – funksiyalarni darajali qatorlarga yoyishdan iborat bo'lib, u mazkur kursning 14-bobida batatsil o'rganildi.

Agar qaralayotgan funksiyalar davriy funksiyalar bo'lsa, tabiiyki ularni soddaroq davriy funksiyalar bilan ifodalash lozim bo'ladi. Har bir hadi soddar davriy funksiyalar bo'lgan funksional qatorlarni o'rganish murakkab davriy funksiyalarni soddaroq davriy funksiyalar bilan ifodalash masalasini hal etishda muhim rol o'yinaydi.

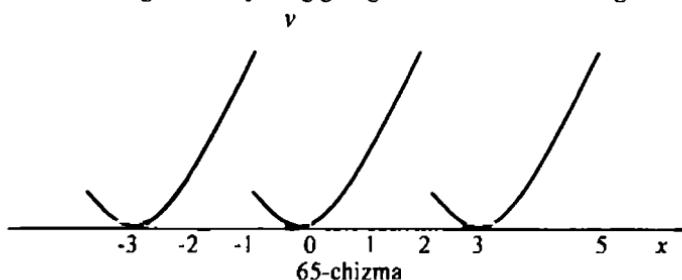

#### I-§. Ba'zi muhim tushunchalar

*I<sup>o</sup>. Funksiyalarni davrom ettirish.*  $f(x)$  funksiya  $(a, s]$  yarim intervalda berilgan bo'lsin. Bu funksiya yordamida quyidagi

$$\begin{aligned} f^*(x) &= f(x - (s-a)m), \quad x \in [a + m(s-a), s + m(s-a)] \\ (m &= 0, \pm 1, \pm 2, \dots) \end{aligned} \quad (20.1)$$

funksiyani tuzamiz. Ravshanki, endi  $f^*(x)$  funksiya  $(-\infty, +\infty)$  oraliqda berilgan va davriy funksiya bo'ladi. Uning davri  $T_0 = s - a$  ga teng. Bajarilgan bu jarayonni funksiyani davriy davom ettirish deyiladi.

Masalan,  $(-1, 2]$  oraliqda berilgan  $f(x) = x^2$  funksiyani davriy davom ettirishdan hosil bo'lgan funksiyaning grafigi 65-chizmada tasvirlangan.

Agarda berilgan  $f(x)$  funksiya  $(a, s]$  da uzluksiz funksiya bo'lsa va  $f(a+0) = \lim_{x \rightarrow a^+} f(x) = f(s)$ ,

deyilsa, u holda davom ettirilgan  $f^*(x)$  funksiya  $(-\infty, +\infty)$  da uzluksiz bo'ladi.

$f(x)$  funksiya  $[a, s]$  yarim intervalda berilgan bo'lsa uni davriy davom ettirish ham yuqorida singari bajariladi:

$$f^*(x) = f(x - (s-a)m), \quad x \in [a + m(s-a), s + m(s-a)] \quad (m = 0, \pm 1, \pm 2, \dots)$$

Agarda  $f(x)$  funksiya  $(a, s]$  da berilgan bo'lsa. uni

$X = (-\infty, +\infty) \setminus \{a + m(s - a) : m = 0, \pm 1, \dots\}$  to'plamga davriy davom ettirish mumkin:

$$f^*(x) = f(x - (s - a)m), x \in (a + m(s - a), s + m(s - a)) \quad (m = 0, \pm 1, \pm 2, \dots)$$

Izoh.  $f(x)$  funksiya  $[a, s]$  da berilgan bo'lsa, uni  $(-\infty, +\infty)$  ga umuman aytganda ikki xil davom ettirish mumkin:

$$f^*(x) = f(x - (s - a)m), x \in (a + (s - a)m, s + (s - a)m],$$

$$f^{**}(x) = f(x - (s - a)m), x \in [a + (s - a)m, s + (s - a)m) \\ (m = 0, \pm 1, \pm 2, \dots).$$

**I-lemma.**  $f(x)$  funksiya  $(a, s]$  oraliqda integrallanuvchi bo'lsin. U holda  $f(x)$  ni  $(-\infty, +\infty)$  ga davriy davom ettirishdan hosil bo'lgan  $f^*(x)$  funksiya ixtiyoriy  $(a, a + (s - a)]$  da integrallanuvchi bo'ladi va

$$\int_a^{a+(s-a)} f^*(x) dx = \int_a^s f(x) dx \quad (*)$$

formula o'tinli bo'ladi.

► Shartga ko'ra  $f(x)$  funksiya  $(a, s]$  da integrallanuvchi,  $f^*(x)$  funksiyaning tuzilishiga binoan (qaralsin, (20.1)) uning  $(a, a + (s - a)]$  ( $\forall a \in R$ ) da integrallanuvchi bo'lishini topamiz.

Integralning xossaliga ko'ra

$$\int_a^{a+(s-a)} f^*(x) dx = \int_a^a f^*(x) dx + \int_a^s f^*(x) dx + \int_s^{a+(s-a)} f^*(x) dx \quad (20.2)$$

bo'ladi. Ravshanki,  $\forall x \in (a, s]$  uchun  $f^*(x) = f(x)$ . Demak,

$$\int_a^{a+(s-a)} f^*(x) dx = \int_a^s f(x) dx.$$

Endi

$$\int_a^{a+(s-a)} f^*(x) dx$$

integralda  $x = y + (s - a)$  almashtirishni bajaramiz:

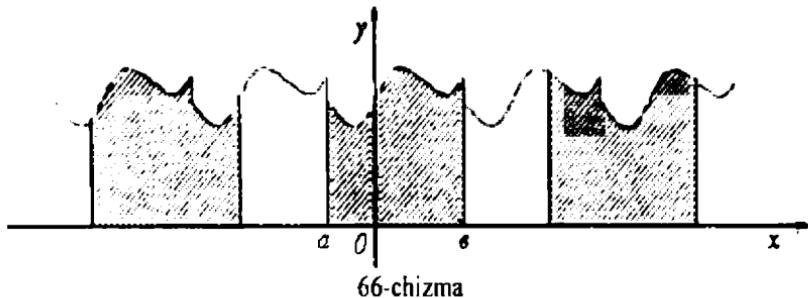

$$\int_a^{a+(s-a)} f^*(x) dx = \int_a^s f^*(y + (s - a)) dy = \int_a^s f^*(y) dy = - \int_s^a f^*(y) dy.$$

Natijada (20.2) tenglik ushu

$$\int_a^{a+(s-a)} f^*(x) dx = \int_a^s f(x) dx$$

ko'rinishga keladi. ►

Bu lemmadagi (\*) formula sodda geometrik ma'noga ega. U 66-chizma shtrixlangan yuzalar bir-biriga tengligini ifodalaydi.

### 2<sup>o</sup>. Garmonikalar. Ushbu

$$f(x) = A \sin(\alpha x + \beta) \quad (20.3)$$

funksiyani ko'raylik, bunda  $A, \alpha, \beta$  o'zgartmas sonlar. Bu davriy funksiya bo'lib, uning asosiy davri  $T = \frac{2\pi}{\alpha}$  ga tengdir. Haqiqatdan ham,

$$f\left(x + \frac{2\pi}{\alpha}\right) = A \sin\left(\alpha\left(x + \frac{2\pi}{\alpha}\right) + \beta\right) = A \sin[(\alpha x + \beta) + 2\pi] = A \sin(\alpha x + \beta) = f(x).$$

Bu

$$f(x) = A \sin(\alpha x + \beta)$$

funksiya garmonika deb ataladi.

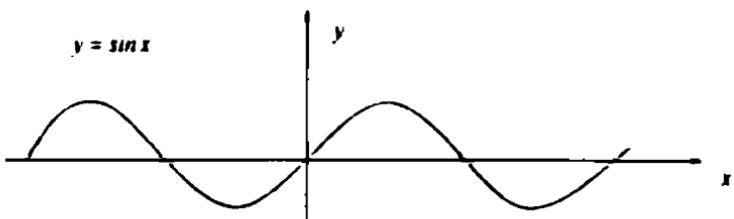

Berilgan

$$f(x) = A \sin(\alpha x + \beta)$$

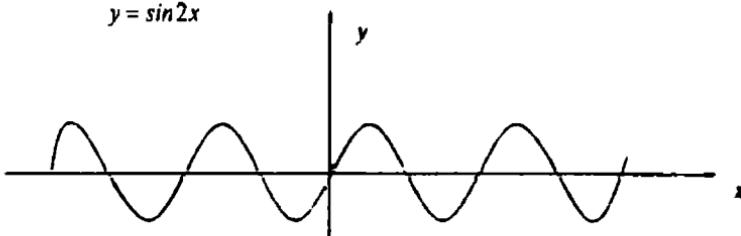

garmonikaning grafigi,  $y = \sin x$  funksiya grafigini  $Ox$  va  $Oy$  o'qlar bo'yicha siqish (cho'zish) hamda  $Ox$  o'qi bo'yicha surish natijasida hosil bo'ladi. Masalan,  
 $f(x) = 2 \sin(2x + 1)$

garmonikaning grafigini yasash jarayoni va uning grafigi 67-chizmada tasvirlangan.

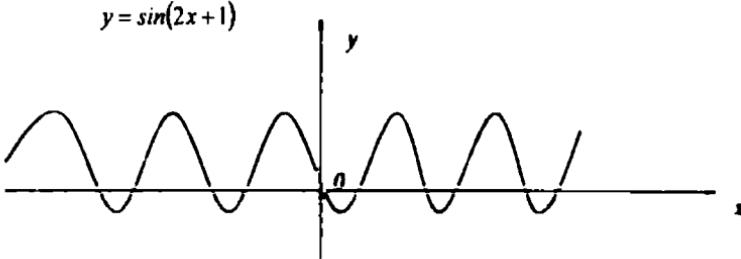

$$y = \sin x$$

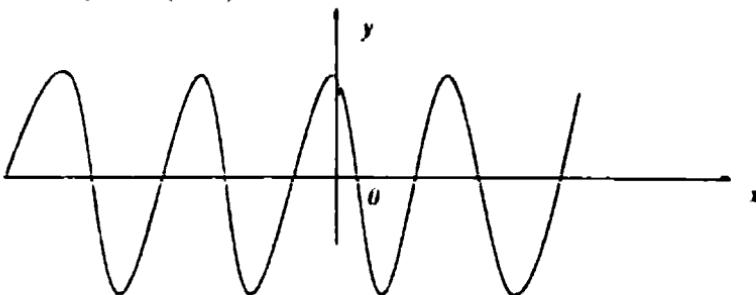

$$y = \sin 2x$$

$$y = \sin(2x + 1)$$

$$y = 2 \sin(2x + 1)$$

67-chizma

Trigonometriyadan ma'lum bo'lgan formuladan foydalaniб гармоникани quyidagicha yozish mumkun:

$$f(x) = A \sin(\alpha x + \beta) = A(\cos \alpha x \sin \beta + \sin \alpha x \cos \beta)$$

Agar

$$A \sin \beta = a, \quad A \cos \beta = b$$

deb belgilasak, unda гармоника ushbu

$$f(x) = a \cos \alpha x + b \sin \alpha x$$

ko'rinishga keladi.

**3'. Bo'lakli-uzluksizlik va bo'lakli-differensialtanuvchilik.**  $f(x)$  funksiya  $[a, b]$  oraliqda berilgan bo'lsin.

Agar  $[a, b]$  oraliqni shunday

$$[a_0, a_1] \cup [a_1, a_2] \cup \dots \cup [a_{n-1}, a_n] \quad (a_0 = a, a_n = b)$$

bo'laklarga ajratish mumkin bo'lsaki,

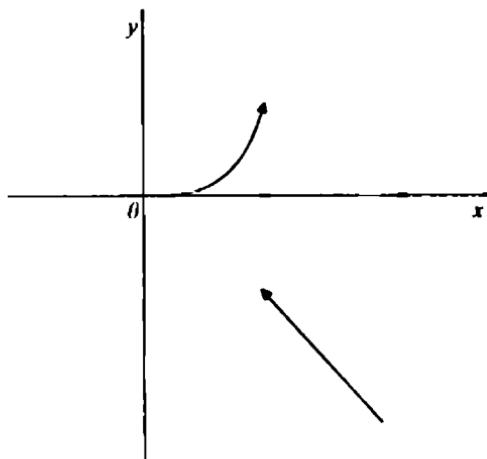

$$([a, b] = [a_0, a_1] \cup [a_1, a_2] \cup \dots \cup [a_{n-1}, a_n])$$

har bir  $(a_k, a_{k+1})$  ( $k = 0, 1, \dots, n-1$ ) da  $f(x)$  funksiya uzluksiz bo'lsa, hamda  $x = a_k$  nuqtalarda chekli o'ng  $f(a_k + 0)$  ( $k = (0, 1, \dots, n-1)$ ) va chap  $f(a_k - 0)$  ( $k = (0, 1, \dots, n-1)$ ) limitlarga ega bo'lsa, u holda  $f(x)$  funksiya  $[a, b]$  da bo'lakli-uzluksiz deb ataladi.

Masalan, ushbu

$$f(x) = \begin{cases} x^3, & \text{agar } 0 \leq x < 1 \text{ bo'lsa,} \\ 0, & \text{agar } x = 1 \text{ bo'lsa,} \\ -x, & \text{agar } 1 < x \leq 2 \text{ bo'lsa} \end{cases}$$

funksiya  $[0, 2]$  oraliqda bo'lakli-uzluksizdir (68-chizma).

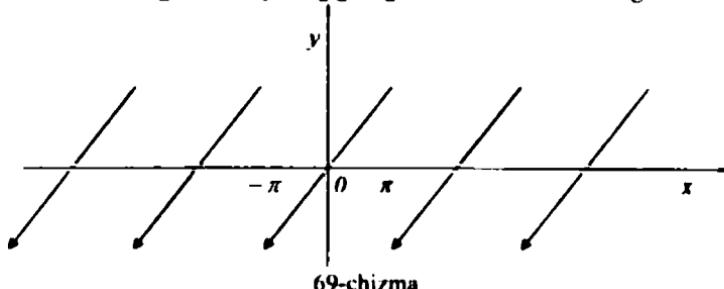

68-chizma

Agar  $f(x)$  funksiya  $(-\infty, +\infty)$  da berilgan bo'lib, uning istalgan chekli  $[\alpha, \beta]$  qismida ( $\{\alpha, \beta\} \subset (-\infty, +\infty)$ ) bo'lakli-uzluksiz bo'lsa, u holda  $f(x)$  funksiya  $(-\infty, +\infty)$  da bo'lakli-uzluksiz deb ataymiz.

Aytaylik,  $f(x)$  funksiya  $(a, \epsilon]$  da berilgan va bo'lakli-uzluksiz bo'lsin. Bu funksiyani  $(-\infty, +\infty)$  ga davriy davom ettirishdan hosil bo'lgan  $f'(x)$  funksiya  $(-\infty, +\infty)$  da bo'lakli-uzluksiz bo'ladi.

Masalan  $f(x) = x$  ( $x \in (-\pi, \pi]$ ) funksiyani  $(-\infty, +\infty)$  ga davriy davom ettirishdan hosil bo'lgan funksiyaning grafigi 69-chizmada tasvirlangan.

69-chizma

Endi bo'lakli-differensiallanuvchanlik tushunchasi bilan tanishamiz.

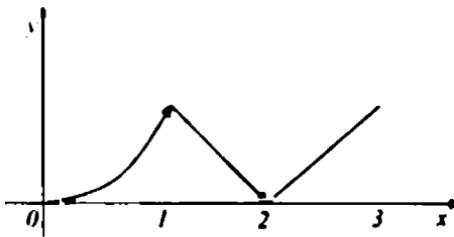

$f(x)$  funksiya  $[a, \epsilon]$  da berilgan bo'lsin.

Agar  $[a, \epsilon]$  oraliqni  $[a, \epsilon] = [a_0, a_1] \cup [a_1, a_2] \cup \dots \cup [a_{n-1}, a_n]$  bo'ladi dan shunday  $[a_0, a_1], [a_1, a_2], \dots, [a_{n-1}, a_n]$  ( $a_0 = a, a_n = \epsilon$ ) bo'laklarga ajratish mumkin bo'lsaki, har bir  $(a_k, a_{k+1})$  da ( $k = 0, 1, \dots, n-1$ ) funksiya differensiallanuvchi bo'lsa hamda  $x = a_k$  nuqtalarda chekli o'ng  $f(a_k + 0)$  ( $k = 0, 1, \dots, n-1$ ) va chap  $f(a_k - 0)$  ( $k = 0, 1, \dots, n-1$ ) hosilalarga ega bo'lsa, u holda  $f(x)$  funksiya  $[a, \epsilon]$  da bo'lakli-differensiallanuvchi deb ataladi.

Masalan, ushbu

$$f(x) = \begin{cases} x^2, & \text{agar } 0 \leq x < 1 \text{ bo'lsa,} \\ 2 - x, & \text{agar } 1 < x < 2 \text{ bo'lsa,} \\ x - 2, & \text{agar } 2 < x \leq 3 \text{ bo'lsa} \end{cases}$$

funksiya  $[0, 3]$  da bo'lakli-differensiallanuvchi bo'ladi. (70-chizma)

70-chizma

Agar  $f(x)$  funksiya  $(-\infty, +\infty)$  da berilgan bo'lib, uning istalgan chekli  $[\alpha, \beta]$  ( $[\alpha, \beta] \subset (-\infty, +\infty)$ ) qismida bo'lakli-differensiallanuvchi bo'lsa, u holda  $f(x)$  funksiya  $(-\infty, +\infty)$  da bo'lakli-differensiallanuvchi deb ataladi.

$f(x)$  funksiya  $[a, b]$  da berilgan va bo'lakli-differensiallanuvchi bo'lsa, uni  $(-\infty, +\infty)$  ga davriy davom ettirishdan hosil bo'lgan  $f'(x)$  funksiya  $(-\infty, +\infty)$  da bo'lakli-differensiallanuvchi bo'ladi.

$f(x)$  funksiya  $[a, b]$  da berilgan bo'lsin. Agar  $[a, b]$  oraliqni  $[a, b] = [a_0, a_1] \cup [a_1, a_2] \cup \dots \cup [a_{n-1}, a_n]$  bo'ladiqan shunday  $[a_0, a_1], [a_1, a_2], \dots, [a_{n-1}, a_n]$  ( $a_0 = a, a_n = b$ ) bo'laklarga ajratish mumkin bo'lsaki, har bir  $[a_k, a_{k+1}]$  da ( $k = 0, 1, 2, \dots, n - 1$ ) funksiya  $f'(x)$  hosilaga ega va bu hosila uzlusiz bo'lsa hamda  $x = a_k$  nuqtalarda chekli o'ng  $f'(a_k + 0)$  ( $k = 0, 1, 2, \dots, n - 1$ ) va chap  $f'(a_k - 0)$  ( $k = 0, 1, 2, \dots, n - 1$ ) hosilalarga ega bo'lsa, u holda  $f(x)$  funksiya  $[a, b]$  da bo'lakli-silliq deb ataladi.

## 2-§. Furye qatorining ta'rifsi

Har bir hadi

$$u_n(x) = a_n \cos nx + b_n \sin nx \quad (n = 0, 1, 2, \dots)$$

garmonikadan iborat ushbu

$$a_0 + \sum_{n=1}^{\infty} (a_n \cos nx + b_n \sin nx) \quad (20.4)$$

funksional qatorni qaraylik.

Odatda (20.4) qator trigonometrik qator deb ataladi  $a_0, a_1, b_1, a_2, b_2, \dots$  sonlar esa trigonometrik qatorning koeffitsientlari deyiladi.

Shunday qilib, trigonometrik qator garchand funksional qator bo'lsa ham (uning har bir hadi muayyan funksiyalar bo'lganligi uchun) o'z koeffitsientlari  $a_0, a_1, b_1, a_2, b_2, \dots, a_n, b_n, \dots$  lar bilan to'la aniqlanadi.

(20.4) trigonometrik qatorning qismiy yig'indisi

$$T_n(x) = a_0 + \sum_{k=1}^n (a_k \cos kx + b_k \sin kx)$$

trigonometrik ko'phad deb ataladi.

1<sup>º</sup>. Furye qatorining ta'rifsi.  $f(x)$  funksiya  $[-\pi, \pi]$  da berilgan va shu oraliqda integrallanuvchi bo'lsin. U holda

$$f(x)\cos nx, f(x)\sin nx \quad (n = 1, 2, 3, \dots)$$

funksiyalar ham, ikkita integrallanuvchi funksiyalar ko'paytmasi sifatida (qaralsin 1-qism, 9-bob, 7-§)  $[-\pi, \pi]$  da integrallanuvchi bo'ladi. Bu funksiyalar integrallarini hisoblab, ularni quyidagicha belgilaylik:

$$a_0 = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) dx,$$

$$a_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \cos nx dx \quad (n = 1, 2, 3, \dots), \quad (20.5)$$

$$b_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \sin nx dx \quad (n = 1, 2, 3, \dots)$$

Bu sonlardan foydalaniib ushbu

$$T(f, x) = \frac{a_0}{2} + \sum_{n=1}^{\infty} (a_n \cos nx + b_n \sin nx) \quad (20.6)$$

trigonometrik qatorni tuzamiz.

*I-ta'rif.*  $a_0, a_1, b_1, a_2, b_2, \dots$  koeffitsientlari (20.5) formulalar bilan aniqlangan (20.6) trigonometrik qator  $f(x)$  funksiyaning Furye qatori deb ataladi.  $a_0, a_1, b_1, a_2, b_2, \dots$  sonlar esa  $f(x)$  funksiyaning Furye koeffitsientlari deyiladi.

Demak, berilgan funksiyaning Furye qatori shunday trigonometrik qatorki. uning koeffitsientlari shu funksiyaga bog'liq bo'llib, (20.5) formulalar bilan aniqlanadi. Shu sababli (20.6) qatorni (uning yaqinlashuvchi yoki uzoqlashuvchi bo'lishidan qat'iy nazar) ushbu “~” belgi bilan quyidagicha yoziladi:

$$f(x) \sim T(f, x) = \frac{a_0}{2} + \sum_{n=1}^{\infty} (a_n \cos nx + b_n \sin nx).$$

### 20. I-misol. Ushbu

$$f(x) = e^{\alpha x} \quad (-\pi \leq x \leq \pi, \alpha \neq 0)$$

funksiyaning Furye qatori topilsin.

◀(20.5) formuladan foydalaniib bu funksiyaning Furye koeffitsientlarini topamiz:

$$a_0 = \frac{1}{\pi} \int_{-\pi}^{\pi} e^{\alpha x} dx = \frac{1}{\pi \alpha} (e^{\alpha x} - e^{-\alpha x}) \Big|_{-\pi}^{\pi} = \frac{2}{\alpha \pi} \operatorname{sh} \alpha \pi,$$

$$a_n = \frac{1}{\pi} \int_{-\pi}^{\pi} e^{\alpha x} \cos nx dx = \frac{1}{\pi} \left[ \frac{\alpha \cos nx + n \sin nx}{\alpha^2 + n^2} e^{\alpha x} \right]_{-\pi}^{\pi} - (-1)^n \frac{1}{\pi} \frac{2\alpha}{\alpha^2 + n^2} \operatorname{sh} \alpha \pi,$$

$$b_n = \frac{1}{\pi} \int_{-\pi}^{\pi} e^{\alpha x} \sin nx dx = \frac{1}{\pi} \left[ \frac{\alpha \sin nx - n \cos nx}{\alpha^2 + n^2} e^{\alpha x} \right]_{-\pi}^{\pi} = (-1)^{n+1} \frac{1}{\pi} \frac{2\alpha}{\alpha^2 + n^2} \operatorname{sh} \alpha \pi,$$

$$(n = 1, 2, 3, \dots)$$

(qarang. I-qism. 8-bob. 2-§).

Demak, berilgan funksiyaning Furye qatori

$$e^{\alpha x} \sim \frac{a_0}{2} + \sum_{n=1}^{\infty} (a_n \cos nx + b_n \sin nx) =$$

$$= \frac{2 \operatorname{sh} \alpha \pi}{\pi} \left[ \frac{1}{2\alpha} + \sum_{n=1}^{\infty} \frac{(-1)^n}{\alpha^2 + n^2} (\alpha \cos nx - n \sin nx) \right]$$

bo'ladi. ▶

2<sup>н</sup>. *Just va toq funksiyalarning Furye qatorlari.* Just va toq funksiyalarning Furye qatorlari birmuncha soddaligini ko'rinishga ega bo'ladi. Biz quyida ularni keltiramiz.

$f(x)$  funksiya  $[-\pi, \pi]$  da berilgan just funksiya bo'lsin. U shu  $[-\pi, \pi]$  oraliqda integrallanuvchi bo'lsin. Ravshanki, bu holda  $f(x)\cos nx$  just funksiya,  $f(x)\sin nx$  ( $n = 1, 2, 3, \dots$ ) esa toq funksiya bo'ladi va ular  $[-\pi, \pi]$  da integrallanuvchi bo'ladi.

$f(x)$  funksiyaning Furye koefitsientlarini topamiz:

$$a_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \cos nx dx = \frac{1}{\pi} \left[ \int_{-\pi}^0 f(x) \cos nx dx + \int_0^{\pi} f(x) \cos nx dx \right] = \\ = \frac{2}{\pi} \int_0^{\pi} f(x) \cos nx dx \quad (n = 0, 1, 2, 3, \dots).$$

$$b_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \sin nx dx = \frac{1}{\pi} \left[ \int_{-\pi}^0 f(x) \sin nx dx + \int_0^{\pi} f(x) \sin nx dx \right] = \\ = \frac{1}{\pi} \left[ - \int_0^{\pi} f(x) \sin nx dx + \int_0^{\pi} f(x) \sin nx dx \right] = 0 \quad (n = 1, 2, 3, \dots)$$

Demak, just  $f(x)$  funksiyaning Furye koefitsientlari

$$a_n = \frac{2}{\pi} \int_0^{\pi} f(x) \cos nx dx \quad (n = 0, 1, 2, \dots) \quad (20.7)$$

$$b_n = 0 \quad (n = 1, 2, 3, \dots)$$

bo'lib, Furye qatori esa

$$f(x) \sim T(f, x) = \frac{a_0}{2} + \sum_{n=1}^{\infty} a_n \cos nx$$

bo'ladi.

Endi  $f(x)$  funksiya  $[-\pi, \pi]$  da berilgan toq funksiya bo'lsin va u shu  $[-\pi, \pi]$  oraliqda integrallanuvchi bo'lsin. Bu holda  $f(x)\cos nx$  toq funksiya,  $f(x)\sin nx$  ( $n = 1, 2, \dots$ ) esa just funksiya bo'ladi.

Funksiyaning Furye koefitsientlarini topamiz:

$$a_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \cos nx dx = \frac{1}{\pi} \left[ \int_{-\pi}^0 f(x) \cos nx dx + \int_0^{\pi} f(x) \cos nx dx \right] = \\ = \frac{1}{\pi} \left[ - \int_0^{\pi} f(x) \cos nx dx + \int_0^{\pi} f(x) \cos nx dx \right] = 0 \quad (n = 0, 1, 2, \dots),$$

$$b_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \sin nx dx = \frac{1}{\pi} \left[ \int_{-\pi}^0 f(x) \sin nx dx + \int_0^{\pi} f(x) \sin nx dx \right] = \\ = \frac{2}{\pi} \int_0^{\pi} f(x) \sin nx dx \quad (n = 1, 2, \dots)$$

Demak, toq  $f(x)$  funksiyaning Furye koefitsientlari

$$a_n = 0 \quad (n = 0, 1, 2, \dots)$$

$$b_n = \frac{2}{\pi} \int_0^{\pi} f(x) \sin nx dx \quad (n = 0, 1, 2, \dots) \quad (20.8)$$

bo'lib, Furye qatori esa

$$f(x) \sim T(f, x) = \sum_{n=1}^{\infty} b_n \sin nx$$

bo'ladi.

**20.2-misol.**  $f(x) = x^2$  ( $-\pi < x < \pi$ ) funksiyaning Furye qatori yozilsin.

◀ (20.7) formulalardan foydalanim berilgan funksiyaning Furye koeffitsientlarini topamiz:

$$a_0 = \frac{2}{\pi} \int_0^\pi x^2 dx = \frac{2}{3}\pi^2,$$

$$a_n = \frac{2}{\pi} \int_0^\pi x^2 \cos nx dx = \frac{2}{\pi} x^2 \frac{\sin nx}{n} \Big|_0^\pi - \frac{4}{n\pi} \int_0^\pi x \sin nx dx =$$

$$= -\frac{4}{n\pi} \left[ \left( -x \frac{\cos nx}{n} \right) \Big|_0^\pi + \int_0^\pi \cos nx dx \right] = (-1)^n \frac{4}{n^2} \quad (n = 1, 2, 3, \dots)$$

Demak  $f(x) = x^2$  juft funksiyaning Furye qatori ushbu

$$x^2 \sim \frac{\pi^2}{3} + \sum_{n=1}^{\infty} (-1)^n \frac{4}{n^2} \cos nx = \frac{\pi^2}{3} - 4 \left( \cos x - \frac{\cos 2x}{2^2} + \frac{\cos 3x}{3^2} - \dots \right)$$

ko'rinishda bo'ladi ►

**20.3-misol.** Ushbu

$$f(x) = x \quad [-\pi \leq x \leq \pi]$$

toq funksiyaning Furye qatori yozilsin.

◀ (20.8) formulalardan foydalanim berilgan funksiyaning Furye koeffitsientlarini topamiz:

$$\bullet. \quad \frac{1}{2} \int_0^\pi x \sin nx dx = -\frac{2}{n\pi} x \cos nx \Big|_0^\pi + \frac{2}{n\pi} \int_0^\pi \cos nx dx =$$

$$-\frac{2}{n} \cos nx = (-1)^{n+1} \frac{2}{n} \quad (n = 1, 2, 3, \dots)$$

Demak,  $f(x) = x$  toq funksiyaning Furye qatori quyidagicha bo'ladi:

$$x \sim \sum_{n=1}^{\infty} (-1)^{n+1} \frac{2}{n} \sin nx = 2 \left( \sin x - \frac{\sin 2x}{2} + \frac{\sin 3x}{3} - \dots \right) \blacktriangleright$$

3\*.  $[-l, l]$  oraliqda berilgan funksiyaning Furye qatori.  $f(x)$  funksiya  $[-l, l]$  ( $l > 0$ ) da berilgan va shu oraliqda integrallanuvchi bo'lsin.

Ravshanki. ushbu

$$t = \frac{x}{l} \quad (20.9)$$

almash tirish  $[-l, l]$  oraliqni  $[-\pi, \pi]$  oraliqqa o'tkazadi. Agar

$$f(x) = f\left(\frac{l}{\pi} t\right) = \phi(t)$$

deyilsa,  $\phi(t)$  funksiyani  $[-\pi, \pi]$  da berilgan va shu oraliqda integrallanuvchi bo'lishini ko'rish qiyin emas. Bu  $\phi(t)$  funksiyaning Furye qatori quyidagicha bo'ladi:

$$\phi(t) \sim T(\phi, t) = \frac{a_0}{2} + \sum_{n=1}^{\infty} (a_n \cos nt + b_n \sin nt)$$

bunda,

$$a_n = \frac{1}{\pi} \int_{-\pi}^{\pi} \varphi(t) \cos nt dt \quad (n = 0, 1, 2, \dots), \quad b_n = \frac{1}{\pi} \int_{-\pi}^{\pi} \varphi(t) \sin nt dt \quad (n = 1, 2, 3, \dots).$$

Yuqoridagi (20.9) tenglikni e'tiborga olsak, unda

$$\varphi\left(\frac{\pi}{l}x\right) = \frac{a_0}{2} + \sum_{n=1}^{\infty} \left( a_n \cos n \frac{\pi}{l} x + b_n \sin n \frac{\pi}{l} x \right)$$

bo'lib, uning koefitsientlari esa

$$a_n = \frac{1}{l} \int_{-l}^l \varphi\left(\frac{\pi}{l}x\right) \cos n \frac{\pi}{l} x dx \quad (n = 0, 1, 2, \dots),$$

$$b_n = \frac{1}{l} \int_{-l}^l \varphi\left(\frac{\pi}{l}x\right) \sin n \frac{\pi}{l} x dx \quad (n = 1, 2, 3, \dots)$$

bo'ladi.

Natijada

$$f(x) = \frac{a_0}{2} + \sum_{n=1}^{\infty} \left( a_n \cos \frac{n\pi x}{l} + b_n \sin \frac{n\pi x}{l} \right) \quad (20.10)$$

ga ega bo'lamiz, bunda

$$a_n = \frac{1}{l} \int_{-l}^l f(x) \cos \frac{n\pi x}{l} dx \quad (n = 0, 1, 2, \dots). \quad (20.11)$$

$$b_n = \frac{1}{l} \int_{-l}^l f(x) \sin \frac{n\pi x}{l} dx \quad (n = 1, 2, 3, \dots)$$

(20.10) ning o'ng tomonidagi trigonometrik qatorni  $[-l, l]$  da berilgan  $f(x)$  ning Furye qatori deyiladi, (20.11) Furye koefitsientlari deyiladi.

**20.4-misol.** Ushbu

$$f(x) = e^x \quad (-1 \leq x \leq 1)$$

funksiyaning Furye qatori yozilsin.

◀ (20.11) formulalardan foydalanib, berilgan funksiyaning Furye koefitsientlarini topamiz:

(bunda  $l=1$ )

$$a_0 = \int_{-1}^1 e^x dx = e - e^{-1},$$

$$a_n = \int_{-1}^1 e^x \cos n\pi x dx = \frac{n\pi \sin n\pi x + \cos n\pi x}{1 + n^2\pi^2} \Big|_{-1}^1 =$$

$$= \frac{1}{1 + n^2\pi^2} (e \cos n\pi - e^{-1} \cos n\pi) = (-1)^n \frac{e - e^{-1}}{1 + n^2\pi^2} \quad (n = 1, 2, \dots)$$

$$b_n = \int_{-1}^1 e^x \sin n\pi x dx = \frac{\sin n\pi x - n\pi \cos n\pi x}{1 + n^2\pi^2} \Big|_{-1}^1 = \frac{1}{1 + n^2\pi^2} (e n\pi \cos n\pi + e^{-1} n\pi \cos n\pi) =$$

$$= \frac{n\pi \cos n\pi}{1 + n^2\pi^2} (e^{-1} - e) = \frac{n\pi (-1)^n}{1 + n^2\pi^2} (e^{-1} - e) = (-1)^{n+1} \frac{e - e^{-1}}{1 + n^2\pi^2} n\pi \quad (n = 1, 2, \dots)$$

Demak,  $f(x) = e^x$  ( $-1 \leq x < 1$ ) funksiyaning Furye qatori ushbu

$$e^x = \frac{e - e^{-1}}{2} + (e - e^{-1}) \sum_{n=1}^{\infty} \left[ \frac{(-1)^n}{1+n^2\pi^2} \cos nx + \frac{(-1)^{n+1}}{1+n^2\pi^2} n\pi \sin nx \right]$$

ko'rinishda bo'ladi. ►

*Izoh.* Ushbu

$$T(f; x) = \frac{a_0}{2} + \sum_{n=1}^{\infty} (a_n \cos nx + b_n \sin nx)$$

trigonometrik qatorning  $(-\infty, +\infty)$  da berilgan  $2\pi$  davrlı funksiya ekanligini ko'rish qiyin emas:

$$T(f; x + 2\pi) = T(f; x).$$

Agar  $[-\pi, \pi]$  da berilgan  $f(x)$  funksiyani  $(-\infty, +\infty)$  ga davriy davom ettirsak (qarang, ushbu bobning 1-§)

$$f^*(x) = f(x - 2\pi m), \quad x \in (-\pi + 2\pi m, \pi + 2\pi m) \quad (m = 0, \pm 1, \pm 2, \dots)$$

u holda, ravshaniki,  $(-\infty, +\infty)$  da

$$f^*(x) \sim T(f^*, x) = \frac{a_0}{2} + \sum_{n=1}^{\infty} (a_n \cos nx + b_n \sin nx)$$

bo'ladi.

### 3-§. Lemmalar. Dirixle integrallari

Funksiyalarni Furye qatoriga yoyish shartlarini aniqlash, yuqorida aytib o'tganimizdek, Furye qatorlari nazariyasining muhim masalalaridan biri. Uni hal etuvchi teoremani keltirishdan avval ba'zi bir faktlarni o'rganamiz.

*1°. Lemmalar.* Quyida keltirilgan lemmalar Furye qatorlari nazariyasida muhim rol o'yaydi.

*2-lemma.*  $[a, b]$  oraliqda berilgan va integrallanuvchi ixtiyoriy  $\varphi(x)$  funksiya uchun

$$\lim_{P \rightarrow \infty} \int_a^b \varphi(x) \sin px dx = 0, \quad (20.12)$$

$$\lim_{P \rightarrow \infty} \int_a^b \varphi(x) \cos px dx = 0. \quad (20.13)$$

bo'ladi.

◀  $[a, b]$  oraliqda biror

$$P = \{x_0, x_1, x_2, \dots, x_n\} \quad (a = x_0 < x_1 < x_2 < \dots < x_n = b)$$

bo'laklashni olaylik. Integralning xossalasiga ko'ra

$$\int_a^b \varphi(x) \sin px dx = \sum_{k=0}^{n-1} \int_{x_k}^{x_{k+1}} \varphi(x) \sin px dx \quad (20.14)$$

bo'ladi.  $\varphi(x)$  funksiya  $[a, b]$  da chegaralangan. Demak,

$$\inf \{\varphi(x) : x \in [x_k, x_{k+1}] \} \quad (k = 0, 1, 2, \dots, n-1)$$

mavjud. Uni  $m_k$  bilan belgilaymiz;

$$m_k = \inf \{\varphi(x) : x \in [x_k, x_{k+1}] \} \quad (k = 0, 1, 2, \dots, n-1).$$

Endi (20.14) integralini

$$\int_a^b \varphi(x) \sin px dx = \sum_{k=0}^{n-1} \int_{x_k}^{x_{k+1}} \varphi(x) \sin px dx =$$

$$= \sum_{k=0}^{n-1} \int_{x_k}^{x_{k+1}} [\varphi(x) - m_k] \sin px dx + \sum_{k=0}^{n-1} m_k \int_{x_k}^{x_{k+1}} \sin px dx = S_1 + S_2 \quad (20.15)$$

ko'rinishda yozib, so'ngra har bir

$$S_1 = \sum_{k=0}^{n-1} \int_{x_k}^{x_{k+1}} [\varphi(x) - m_k] \sin px dx,$$

$$S_2 = \sum_{k=0}^{n-1} m_k \int_{x_k}^{x_{k+1}} \sin px dx$$

qo'shiluvchini baholaymiz.

Agar  $\omega_k \varphi(x)$  funksiyaning  $[x_k, x_{k+1}]$  ( $k = 0, 1, 2, \dots, n-1$ ) dagi tebranishi bo'lisa,  $S_1$  uchun ushbu

$$|S_1| \leq \sum_{k=0}^{n-1} \int_{x_k}^{x_{k+1}} \omega_k dx = \sum_{k=0}^{n-1} \omega_k \Delta x_k \quad (\Delta x_k = x_{k+1} - x_k) \quad (20.16)$$

tengsizlikka ega bo'lamiz. Shartga ko'ra  $\varphi(x)$  funksiya  $[a, b]$  da integrallanuvchi. Unda 1-qism. 9-bob. 5-§ da keltirilgan teoremaga asosan,  $\forall \varepsilon > 0$  olinganda ham, shunday  $\delta > 0$  topiladiki,  $[a, b]$  oraliqning diametri  $\lambda_p < \delta$  bo'lgan har qanday  $P$  bo'laklashi uchun

$$\sum_{k=0}^{n-1} \omega_k \Delta x_k < \frac{\varepsilon}{2} \quad (20.17)$$

bo'ladi. (20.16) va (20.17) munosabatlardan

$$|S_1| < \frac{\varepsilon}{2} \quad (20.18)$$

bo'lishi kelib chiqadi.

Endi  $S_2 = \sum_{k=0}^{n-1} m_k \int_{x_k}^{x_{k+1}} \sin px dx$  yig'indini baholaymiz. Ravshanki,

$$\left| \int_{x_k}^{x_{k+1}} \sin px dx \right| = \left| \frac{\cos px_k - \cos px_{k+1}}{p} \right| \leq \frac{2}{p}$$

Demak,  $|S_2| \leq \frac{2}{p} \sum_{k=0}^{n-1} |m_k|$  bo'ladi.  $p$  ni yetarli katta qilib olish hisobiga

$$\frac{2}{p} \sum_{k=0}^{n-1} |m_k| < \frac{\varepsilon}{2} \quad (20.19)$$

bo'ladi. Natijada (20.15), (20.18) va (20.19) munosabatlardan yetarli katta  $p$  lar uchun  $\left| \int_a^b \varphi(x) \sin px dx \right| < \varepsilon$  bo'lishi kelib chiqadi. Demak,

$$\lim_{p \rightarrow \infty} \int_a^b \varphi(x) \sin px dx = 0$$

(20.13) munosabatning o'rini bo'lishi xuddi shunga o'xshash ko'rsatiladi. ►

Xususan,  $\varphi(x)$  funksiya  $[a, b]$  oraliqda bo'lakli-uzluksiz bo'tsa, uning uchun lemmanning tasdig'i o'rinni bo'ladi.

*I-estatma.* Lemmadagi

$$J(p) = \int_a^b \varphi(x) \sin px dx, \quad J_1(p) = \int_a^b \varphi(x) \cos px dx$$

integrallar, ravshanki, parametrga ( $p$  – parametr) bog'liq integrallardir. Mazkur kursning 17-bob, 5-§ ida biz bunday integrallarning limitini integral belgisi ostida limitga o'tib hisoblash haqidagi teoremani isbot qilgan edik. Bu teorema shartlari yuqoridagi integrallar uchun bajarilmaydi ( $p \rightarrow \infty$  da integral ostidagi funksiyaning limiti mavjud emas) va demak, undan foydalana olmaymiz. Shuning uchun ham 2-lemma yuqorida alchida isbotlandi. Ikkinci tomonidan lemma parametrga bog'liq integrallarning limitini bevosita, integral belgisi ostida limitga o'tmasdan ham, hisoblash mumkin ekanligiga misol bo'ladi.

Yuqoridagi lemma chegaralanmagan funksiyaning hosmas integrali uchun ham umumlashtirilishi mumkin.

$\varphi(x)$  funksiya  $[a, b]$  yarim integralda berilgan.  $a$  nuqta shu funksiyaning maxsus nuqtasi bo'lsin.

*3-lemma.*  $[a, b]$  da absolyut integrallanuvchi ixtiyoriy  $\varphi(x)$  funksiya uchun

$$\lim_{p \rightarrow \infty} \int_a^b \varphi(x) \sin px dx = 0,$$

$$\lim_{p \rightarrow \infty} \int_a^b \varphi(x) \cos px dx = 0 \quad (20.20)$$

bo'ladi.

◀ Ixtiyoriy  $\eta$  ( $0 < \eta < b - a$ ) olib

$$\int_a^b \varphi(x) \sin px dx$$

integralni quyidagicha yozib

$$\int_a^b \varphi(x) \sin px dx = \int_a^{a+\eta} \varphi(x) \sin px dx + \int_{a+\eta}^b \varphi(x) \sin px dx \quad (20.21)$$

bu tenglikning o'ng tomonidagi har bir qo'shiluvchini baholaymiz.

Qaralayotgan  $\varphi(x)$  funksiya  $[a, b - \eta]$  da integrallanuvchi bo'lganligi sababli yuqorida keltirilgan 2-lemmaga ko'ra

$$\lim_{p \rightarrow \infty} \int_a^{a+\eta} \varphi(x) \sin px dx = 0$$

bo'ladi. Demak,  $\forall \varepsilon > 0$  olganda ham, shunday  $p_0 > 0$  topiladiki, barcha  $p > p_0$  uchun

$$\left| \int_a^{a+\eta} \varphi(x) \sin px dx \right| < \frac{\varepsilon}{2} \quad (20.22)$$

bo'ladi.

Shunga ko'ra  $\varphi(x)$  funksiya  $[a, b]$  da absolyut integrallanuvchi. Ta'rifga binoan  $\forall \varepsilon > 0$  olganda ham shunday  $\delta > 0$  topiladiki,  $0 < \eta < \delta$  bo'lganda

$\int_{a+\eta}^b |\varphi(x)| dx < \frac{\varepsilon}{2}$  bo'ladi. Demak,

$$\left| \int_{a-\eta}^a \sin px\varphi(x)dx \right| \leq \int_{a-\eta}^a |\varphi(x)|dx < \frac{\varepsilon}{2} \quad (20.23)$$

Yuqoridagi (20.21), (20.22) va (20.23) munosabatlardan yetarli katta  $p$  lar uchun

$$\left| \int_a^b \varphi(x) \sin px dx \right| < \varepsilon \text{ bo'lishi kelib chiqadi. Demak, } \lim_{p \rightarrow \infty} \int_a^b \varphi(x) \sin px dx = 0$$

(20.20) munosabatning o'rini bo'lishi xuddi shunga o'xshash ko'rsatiladi. ► Isbot etilgan lemmalardan muhim natija kelib chiqadi.

**1-natija.**  $[-\pi, \pi]$  oraliqda ho'lakli-uzluksiz yoki shu oraliqda absolyut integrallanuvchi  $f(x)$  funksiyaning Furye koefitsientlari  $n \rightarrow \infty$  da nolga intiladi:

$$\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \cos nx dx = 0,$$

$$\lim_{n \rightarrow \infty} b_n = \lim_{n \rightarrow \infty} \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \sin nx dx = 0.$$

**2<sup>o</sup>. Dirixle integrali.** Furye qatorining yaqinlashuvchi ekanini o'rganish, bu qator qismiy yig'indilari ketma-ketligining limitini aniqlash demakdir. Shu maqsadda qator qismiy yig'indisini qulay ko'rinishda yozib olamiz.

$f(x)$  funksiya  $[-\pi, \pi]$  oraliqda berilgan va absolyut integrallanuvchi (xos yoki xosmas ma'noda) bo'lsin. Bu funksiyaning Furye koefitsientlarini topib,

$$a_k = \frac{1}{\pi} \int_{-\pi}^{\pi} f(t) \cos kt dt \quad (k = 0, 1, 2, \dots).$$

$$b_k = \frac{1}{\pi} \int_{-\pi}^{\pi} f(t) \sin kt dt \quad (k = 1, 2, \dots)$$

so'ngra topilgan koefitsientlar bo'yicha  $f(x)$  funksiyaning Furye qatorini tuzamiz:

$$f(x) \sim T(f, x) = \frac{a_0}{2} + \sum_{k=1}^{\infty} (a_k \cos kx + b_k \sin kx).$$

Endi bu qatorning ushbu

$$F_n(f, x) = \frac{a_0}{2} + \sum_{k=1}^n (a_k \cos kx + b_k \sin kx)$$

qismiy yig'indisini olamiz. Bu yig'indidagi  $a_k$  ( $k = 0, 1, 2, \dots$ ) va  $b_k$  ( $k = 1, 2, \dots$ ) larning o'rniiga ularning ifodalarini qo'ysak, u holda

$$F_n(f, x) = \frac{1}{2\pi} \int_{-\pi}^{\pi} f(t) dt + \sum_{k=1}^n \frac{1}{\pi} \int_{-\pi}^{\pi} f(t) [\cos kt \cos kx + \sin kt \sin kx] dt.$$

Ma'lumki,

$$\cos kt \cos kx + \sin kt \sin kx = \cos k(t - x).$$

Demak,

$$F_n(f, x) = \frac{1}{\pi} \int_{-\pi}^{\pi} f(t) \left[ \frac{1}{2} + \sum_{k=1}^n \cos k(t - x) \right] dt.$$

Integral ostidagi ifoda uchun quyidagi munosabat o'rini:

$$\frac{1}{2} + \sum_{k=1}^{\infty} \cos k(t-x) = \frac{\sin(2n+1)\frac{t-x}{2}}{2 \sin \frac{t-x}{2}}$$

Xaqqatdan ham.

$$\begin{aligned} 2 \sin \frac{u}{2} \left[ \frac{1}{2} + \sum_{k=1}^{\infty} \cos ku \right] &= \sin \frac{u}{2} + \sum_{k=1}^{\infty} 2 \sin \frac{u}{2} \cos ku = \\ &= \sin \frac{u}{2} + \sum_{k=1}^{\infty} \left[ \sin \left( k + \frac{1}{2} \right) u - \sin \left( k - \frac{1}{2} \right) u \right] = \sin \left( n + \frac{1}{2} \right) u. \end{aligned}$$

$(u = t - x)$

Bu tenglik yordamida  $F_n(f; x)$  yig'indi quyidagicha ifodalanadi:

$$F_n(f; x) = \frac{1}{2\pi} \int_{-\pi}^{\pi} f(t) \frac{\sin(2n+1)\frac{t-x}{2}}{\sin \frac{t-x}{2}} dt \quad (20.24)$$

(20.24) tenglikning o'ng tomonidagi integral  $f(x)$  funksiyaning Dirixle integrali deb ataladi.

Shunday qilib  $f(x)$  funksiya Furye qatorining qismiy yig'indisi  $F_n(f; x)$  parametrga bog'iq (20.24) ko'rinishidagi integral (Dirixle integrali) dan iborat ekan.

$f'(x)$  funksiya  $f(x)$  funksiyaning  $(-\infty, +\infty)$  ga davriy davomi bo'lsin. Binobarin  $f'(x)$  funksiya  $(-\infty, +\infty)$  da berilgan,  $2\pi$  davrli  $[-\pi, +\pi]$  da absolyut integrallanuvchi funksiyadir. Qulaylik uchun biz quyida  $f(x)$  funksiyaning o'zini  $(-\infty, +\infty)$  da berilgan,  $2\pi$  davrli,  $[-\pi, +\pi]$  da absolyut integrallanuvchi funksiya deb hisoblaymiz va  $f'(x)$  o'rniiga  $f(x)$  yozib ketaveramiz.

Endi.

$$F_n(f, x) = \frac{1}{2\pi} \int_{-\pi}^{\pi} f(t) \frac{\sin(2n+1)\frac{t-x}{2}}{\sin \frac{t-x}{2}} dt$$

integralda  $t = x + u$  almashtirish qilamiz. Integral ostidagi funksiya davrli funksiya bo'lganligi sababli, bu almashtirish natijasida integrallash chegarasi o'zgarmasdan qoladi (ushbu bobning 1-§ iga qaralsin).

Natija

$$F_n(f, x) = \frac{1}{2\pi} \int_{-\pi}^{\pi} f(x+u) \frac{\sin(2n+1)\frac{u}{2}}{\sin \frac{u}{2}} du$$

bo'ladi. Bu integralni ushbu

$$F_n(f; x) = \frac{1}{2\pi} \left| \int_{-\pi}^0 f(x+u) \frac{\sin(2n+1)\frac{u}{2}}{\sin \frac{u}{2}} du + \int_0^\pi f(x+u) \frac{\sin(2n+1)\frac{u}{2}}{\sin \frac{u}{2}} du \right|$$

ikki qismga ajratib, o'ng tomonidagi birinchi integralda u o'zgaruvchini  $-u$  ga almashtiramiz. U holda

$$F_n(f; x) = \frac{1}{\pi} \int_0^\pi [f(x+u) + f(x-u)] \frac{\sin\left(n+\frac{1}{2}\right)u}{2\sin\frac{u}{2}} du \quad (20.25)$$

bo'ladi. Dirixle integrali  $F_n(f; x)$  ning bu ko'rinishidan kelgusida foydalaniladi.

Xususan,  $f(x) = 1$  bo'lsa, (20.25) munosabatdan

$$1 = \frac{2}{\pi} \int_0^\pi \frac{\sin\left(n+\frac{1}{2}\right)u}{2\sin\frac{u}{2}} du \quad (n=1,2,3,\dots) \quad (20.26)$$

bo'lishi kelib chiqadi. Haqiqatdan ham, bu holda

$$\alpha_0 = 2, \alpha_k = \epsilon_k = 0 \quad (k=1,2,3,\dots)$$

bo'lib,

$$F_n(f; x) \equiv 1$$

bo'ladi.

#### 4-8. Furye qatorining yaqinlashuvchiligi

Endi berilgan  $f(x)$  funksiya qanday shartlarni bajarganda, uning Furye qatori yaqinlashuvchi bo'lishini topish bilan shug'ullanamiz.

*Iº. Lokallashtirish prinsipi.* Yuqorida keltirilgan Dirixle integrali

$$F_n(f; x) = \frac{1}{\pi} \int_0^\pi [f(x+u) + f(x-u)] \frac{\sin\left(n+\frac{1}{2}\right)u}{2\sin\frac{u}{2}} du$$

quyidagi muhim xossaga ega. Ixtiyoriy  $\delta$  ( $0 < \delta < \pi$ ) sonni olib, (20.25) integralni ikki qismga ajratamiz:

$$F_n(f; x) = \frac{1}{\pi} \int_0^\delta [f(x+u) + f(x-u)] \frac{\sin\left(n+\frac{1}{2}\right)u}{2\sin\frac{u}{2}} du + \\ + \frac{1}{\pi} \int_\delta^\pi [f(x+u) + f(x-u)] \frac{\sin\left(n+\frac{1}{2}\right)u}{2\sin\frac{u}{2}} du = J_1(n, \delta) + J_2(n, \delta)$$

O'ng tomonidagi ikkinchi

$$J_2(n, \delta) = \frac{1}{\pi} \int_{-\delta}^{\pi} [f(x+u) + f(x-u)] \frac{\sin\left(n + \frac{1}{2}\right)u}{2 \sin \frac{u}{2}} du$$

integralning  $n \rightarrow \infty$  da limiti mavjud va nolga teng. Haqiqatdan ham, berilgan  $f(x)$  funksiya  $[-\pi, \pi]$  da va demak  $[\delta, \pi]$ da absolyut integrallanuvchi bo'lganligidan

$$\varphi(u) = \frac{1}{2 \sin \frac{u}{2}} [f(x+u) + f(x-u)]$$

funksiya ham shu oraliqda absolyut integrallanuvchi bo'ladi ( $[\delta, \pi]$ ) da  $\sin \frac{u}{2}$  funksiya chegaralangan) va 3-lemmaga asosan

$$\lim_{n \rightarrow \infty} J_2(n, \delta) = \lim_{n \rightarrow \infty} \int_{-\delta}^{\pi} \varphi(u) \sin\left(n + \frac{1}{2}\right) u du = 0$$

Natijada quyidagi teoremaga kelamiz.

**I-teorema.** Ushbu

$$J_1(n, \delta) = \frac{1}{\pi} \int_0^\delta [f(x+u) + f(x-u)] \frac{\sin\left(n + \frac{1}{2}\right)u}{2 \sin \frac{u}{2}} du$$

integralning  $n \rightarrow \infty$  dagi limiti mavjud bo'lgandagina Dirixle integralining  $n \rightarrow \infty$  dagi limiti mavjud bo'ladi va

$$\lim_{n \rightarrow \infty} F_n(f, x) = \lim_{n \rightarrow \infty} J_1(n, \delta).$$

Ravshanki,  $J_1(n, \delta)$  integralda  $f$  funksiyaning  $[x - \delta, x + \delta]$  oraliqdagi qiymatlarigina qatnashadi.

Shunday qilib, berilgan  $f(x)$  funksiya Furye qatorining  $x$  nuqtada yaqinlashuvchi yoki uzoqlashuvchi bo'lishi bu funksiyaning shu nuqta  $(x - \delta, x + \delta)$  atrofidaga qiymatlarigagina bog'liq bo'lar ekan. Shuning uchun keltirilgan teorema lokallashtirish prinsipi deb yuritiladi.

Uning mohiyatini quyidagicha ham tushintirish mumkin.

Ikkita turli  $2\pi$  davrlı  $f(x)$  va  $\varphi(x)$  funksiyalarning har biri  $(-\pi, \pi)$  da absolyut integrallanuvchi bo'lsin. Ravshanki, bu funksiyalarning Furye qotorlari ham, umuman aytganda, turlicha bo'ladi. Biror  $x_0 \in (-\pi, \pi)$  va  $\delta$  ( $0 < \delta < \pi$ ) uchun

$$f(x) = \varphi(x), \text{ agar } x \in [x_0 - \delta, x_0 + \delta],$$

$$f(x) \neq \varphi(x), \text{ agar } x \in [-\pi, \pi] \setminus [x_0 - \delta, x_0 + \delta]$$

bo'lsa, u holda  $n \rightarrow \infty$  da bu funksiyalar Furye qotorlari qismiy yig'indilarining  $x_0$  nuqtadagi limitlari yoki bir vaqtida mavjud (bu holda ular bir-biriga teng) bo'ladi, yoki ular bir vaqtida mavjud bo'lmaydi.

Pirovardida, o'quvchilarimiz e'tiborini lokallashtirish prinsipining yana bir muhim tomoniga jahz qilaylik.

Keltirilgan teoremdan  $J_n(f, \delta)$  integralning  $n \rightarrow \infty$  dagi limiti barcha  $\delta$  ( $0 < \delta < \pi$ ) lar uchun bir vaqtida yoki mavjud bo'lishi, yoki mavjud bo'lmasligi kelib chiqadi.

### 2<sup>º</sup>. Furye qatorining yaqinlashuvchiligi.

**2-teorema.**  $2\pi$  davrli  $f(x)$  funksiya  $[-\pi, \pi]$  oraliqda bo'lakli-differensiala-nuvchi funksiya bo'lsa, u holda hu funksiyaning Furye qatori

$$\frac{a_0}{2} + \sum_{k=1}^{\infty} (a_k \cos kx + b_k \sin kx)$$

$[-\pi, \pi]$  da yaqinlashuvchi bo'ladi. Uning yig'indisi

$$T(f, x) = \frac{a_0}{2} + \sum_{k=1}^{\infty} (a_k \cos kx + b_k \sin kx) = \frac{f(x+0) + f(x-0)}{2}$$

bo'ladi.  $(x \in [-\pi, \pi])$

◀ (20.26) tenglikning har ikki tomoni

$$\frac{1}{2} [f(x+0) + f(x-0)]$$

ga ko'paytirib quyidagini topamiz

$$\frac{1}{2} [f(x+0) + f(x-0)] = \frac{2}{\pi} \int_0^\pi \frac{1}{2} [f(x+0) + f(x-0)] \frac{\sin(n + \frac{1}{2})u}{2 \sin \frac{u}{2}} du \quad (20.27)$$

(20.25) va (20.27) munosabatlardan foydalanim ushbu

$$F_n(f, x) - \frac{1}{2} [f(x+0) + f(x-0)]$$

ayirmani quyidagicha yozish mumkin

$$\begin{aligned} F_n(f, x) - \frac{1}{2} [f(x+0) + f(x-0)] &= \\ &= \frac{1}{\pi} \int_0^\pi [f(x+u) + f(x-u) - f(x+0) - f(x-0)] \frac{\sin(n + \frac{1}{2})u}{2 \sin \frac{u}{2}} du. \end{aligned}$$

Agar

$$\frac{1}{\pi} \int_0^\pi [f(x+u) - f(x+0)] \frac{\sin(n + \frac{1}{2})u}{2 \sin \frac{u}{2}} du = J_{1n}(f, x).$$

$$\frac{1}{\pi} \int_0^\pi [f(x-u) - f(x-0)] \frac{\sin(n + \frac{1}{2})u}{2 \sin \frac{u}{2}} du = J_{2n}(f, x)$$

deb belgilasak, unda

$$F_n(f; x) - \frac{1}{2} [f(x+0) + f(x-0)] = J_{1n}(f; x) + J_{2n}(f; x)$$

bo'ladi.

Endi  $J_{1n}(f; x)$  va  $J_{2n}(f; x)$  lami baholaymiz. Ixtiyoriy  $\delta$  ( $0 < \delta < \pi$ ) sonni olib  $J_{1n}(f; x)$  ni ikki qismga ajratib yozamiz:

$$\begin{aligned} J_{1n}(f; x) &= \frac{1}{\pi} \int_0^\pi [f(x+u) - f(x+0)] \frac{\sin\left(n + \frac{1}{2}\right)u}{2 \sin \frac{u}{2}} du + \\ &+ \frac{1}{\pi} \int_\delta^\pi [f(x+u) - f(x+0)] \frac{\sin\left(n + \frac{1}{2}\right)u}{2 \sin \frac{u}{2}} du. \end{aligned} \quad (20.28)$$

Lokallashtirish prinsiga asosan

$$\lim_{n \rightarrow \infty} \frac{1}{\pi} \int_\delta^\pi [f(x+u) - f(x+0)] \frac{\sin\left(n + \frac{1}{2}\right)u}{2 \sin \frac{u}{2}} du = 0$$

bo'ladi. Demak,  $\forall \varepsilon > 0$  olinganda ham, shunday  $n_0 = n_0(\varepsilon, \delta) \in N$  topiladi.  $\forall n > n_0$  uchun

$$\left| \frac{1}{\pi} \int_\delta^\pi [f(x+u) - f(x+0)] \frac{\sin\left(n + \frac{1}{2}\right)u}{2 \sin \frac{u}{2}} du \right| < \frac{\varepsilon}{2} \quad (20.29)$$

bo'ladi.

Endi (20.28) tenglikning o'ng tomonidagi birinchi integralni baholaylik. Uni  $\delta$  ni tanlab olish hisobiga yetarlichcha kichik qila olishimiz mumkinligini ko'rsataylik.

Shartga ko'ra,  $f(x)$  funksiya  $[-\pi, \pi]$  da bo'lakli-differensiallanuvchi, Bino-barin.  $\forall x \in [-\pi, \pi]$  nuqtada uning bir tomonli chekli hosilalari, xususan, o'ng hosilasi

$$\lim_{u \rightarrow 0} \frac{f(x+u) - f(x+0)}{u} = f'(x+0)$$

mayjud. Demak, shunday  $\delta_1 > 0$  topiladiki  $0 < u < \delta_1$  bo'lganda

$$\left| \frac{f(x+u) - f(x+0)}{u} \right| \leq M_1 \quad (M_1 = \text{const})$$

bo'ladi.

Shungdek, shunday  $\delta_2 > 0$  topiladiki,  $0 < u < \delta_2$  bo'lganda

$$\frac{\frac{2}{\sin \frac{u}{2}}}{u} \leq M_2 \quad (M_2 = \text{const})$$

bo'ladi.

Agar  $\delta = \min \left\{ \delta_1, \delta_2, \frac{\pi \epsilon}{2M_1 M_2} \right\}$  deyilsa, unda ixtiyoriy  $n \in N$  uchun

$$\begin{aligned} & \left| \frac{1}{\pi} \int_0^\delta \left| \frac{f(x+u) - f(x-0)}{u} \right| \left| \frac{\frac{u}{2}}{\sin \frac{u}{2}} \sin \left( n + \frac{1}{2} \right) u du \right| \right| \\ & < \frac{1}{\pi} \int_0^\delta \left| \frac{f(x+u) - f(x-0)}{u} \right| \left| \frac{\frac{u}{2}}{\sin \frac{u}{2}} \right| du \leq \frac{1}{\pi} M_1 M_2 \delta < \frac{\epsilon}{2} \end{aligned} \quad (20.30)$$

bo'ladi.

Natijada (20.28), (20.29) va (20.30) munosabatlardan  $\forall \epsilon > 0$  olinganda ham. shunday  $n_0 \in N$  topiladiki, barcha  $n > n_0$  uchun  $|J_{2n}(f, x)| < \epsilon$  bo'lishi kelib chiqadi.

Ikkinchi integral

$$J_{2n}(f, x) = \frac{1}{\pi} \int_0^\pi [f(x-u) - f(x+0)] \frac{\sin \left( n + \frac{1}{2} \right) u}{2 \sin \frac{u}{2}} du$$

ham xuddi shunga o'xshash baholanadi va  $|J_{2n}(f, x)| < \epsilon$  bo'lishi topiladi. Demak,  $\forall \epsilon > 0$  olinganda ham. shunday  $n_0 \in N$  topiladiki, barcha  $n > n_0$  uchun

$$|F_n(f, x) - \frac{1}{2} [f(x+0) + f(x-0)]| < 2\epsilon$$

bo'ladi. Bu esa

$$\lim_{n \rightarrow \infty} F_n(f, x) = \frac{1}{2} [f(x+0) + f(x-0)]$$

ekanini bildiradi.

Shunday qilib,  $f(x)$  funsianing Furye qatori  $[-\pi, \pi]$  da yaqinlashuvchi, uning yig'indisi  $T(f, x)$  esa  $\frac{1}{2} [f(x+0) + f(x-0)]$  ga teng

$$T(f, x) = \frac{a_0}{2} + \sum_{k=1}^{\infty} (a_k \cos kx + b_k \sin kx) = \frac{1}{2} [f(x+0) + f(x-0)]. \blacktriangleright$$

Ravshanki, teorema shartlarini qanoatlantiruvchi  $f(x)$  funsianing uzliksizlik nuqtalarida

$$T(f, x) = \frac{f(x+0) + f(x-0)}{2} = f(x)$$

bo'ladi.

$x = \pm\pi$  bo'lganda ushbu bobning 1-§ ida aytilgan ushhu  
 $f(\pi + 0) = f(-\pi + 0) = f(\pi - 0)$

tengliklar e'tiborga olinsa, unda

$$\lim_{n \rightarrow \infty} F_n(f; -\pi) = \frac{f(-\pi + 0) + f(-\pi - 0)}{2} = \frac{f(-\pi + 0) + f(\pi - 0)}{2}$$

$$\lim_{n \rightarrow \infty} F_n(f; \pi) = \frac{f(\pi + 0) + f(\pi - 0)}{2} = \frac{f(-\pi + 0) + f(\pi - 0)}{2}$$

bo'ladi. Demak,

$$\lim_{n \rightarrow \infty} F_n(f; -\pi) = \lim_{n \rightarrow \infty} F_n(f; \pi) = \frac{1}{2} [f(-\pi + 0) + f(\pi - 0)]$$

yani

$$T(f; -\pi) = T(f; \pi) = \frac{1}{2} [f(-\pi + 0) + f(\pi - 0)]$$

bo'ladi.

**2-natija.** Agar  $2\pi$  davrli  $f(x)$  funksiya  $[-\pi, \pi]$  da uzuksiz, bo'lakli-differensiallanuvchi va  $f(-\pi) = f(\pi)$  bo'lsa, bu funksiyaning Furye qatori  $[-\pi, \pi]$  da yaqinlashuvchi, yig'indisi

$$T(f; x) = f(x) \quad (x \in [-\pi, \pi])$$

bo'ladi.

#### 20.5-misol. Ushbu

$$f(x) = x^2 \quad (x \in [-\pi, \pi])$$

funksiyani Furye qatoriga yoyilsin.

◀ Ma'lumki;

$$x^2 - \frac{\pi^2}{3} + \sum_{k=1}^{\infty} (-1)^k \frac{4}{k^2} \cos kx = \frac{\pi^2}{3} - 4 \left( \cos x - \cos \frac{\cos 2x}{2^2} + \frac{\cos 3x}{3^2} - \dots \right).$$

Ravshanki,  $x^2$  funksiya  $[-\pi, \pi]$  da oraliqda 2-natijaning shartlarini qanoatlantiradi. Shu natijaga ko'rta.  $[-\pi, \pi]$  da uning Furye qotori yaqinlashuvchi, yig'indisi esa  $x^2$  ga teng bo'ladi.

$$x^2 = \frac{\pi^2}{3} + \sum_{k=1}^{\infty} (-1)^k \frac{4}{k^2} \cos kx = \frac{\pi^2}{3} - 4 \left( \cos x - \cos \frac{\cos 2x}{2^2} + \frac{\cos 3x}{3^2} - \dots \right) \quad (x \in [-\pi, \pi]) ▶$$

#### 20.6-misol. Ushbu

$$f(x) = \cos ax \quad (0 < a < 1)$$

funksiyani Furye qatoriga yoyilsin.

◀ Furye koeffitsientlari

$$a_0 = \frac{2}{\pi} \int_0^\pi \cos ax dx = 2 \frac{\sin a\pi}{a\pi}.$$

$$a_n = \frac{2}{\pi} \int_0^\pi \cos ax \cos nx dx = \frac{1}{\pi} \int_0^\pi (\cos(a+n)x + \cos(a-n)x) dx = (-1)^n \frac{2a}{a^2 - n^2} \frac{\sin a\pi}{\pi} \quad (n = 1, 2, 3, \dots),$$

$$b_n = 0 \quad (n = 1, 2, 3, \dots)$$

bo'ldi. Demak, berilgan funksiyaning Furye qatorini

$$\cos ax \sim \frac{\sin a\pi}{a\pi} + \frac{2a \sin a\pi}{\pi} \sum_{n=1}^{\infty} \frac{(-1)^n}{a^2 - k^2} \cos kx$$

bo'ldi. Agar bu  $f(x) = \cos ax$  funksiya 2-natijaning shartlarni bajarishini e'tibor-ga olsak, unda

$$\cos ax = \frac{\sin a\pi}{a\pi} + \frac{2a \sin a\pi}{\pi} \sum_{n=1}^{\infty} \frac{(-1)^n}{a^2 - k^2} \cos kx$$

bo'lishini topamiz.

Keyingi tenglikdan  $x = 0$  deyilsa

$$1 = \frac{\sin a\pi}{a\pi} \left[ \frac{1}{a} + 2a \sum_{k=1}^{\infty} \frac{(-1)^k}{a^2 - k^2} \right]$$

ya'ni

$$\frac{\pi}{\sin a\pi} = \frac{1}{a} + \sum_{k=1}^{\infty} (-1)^k \left( \frac{1}{a+k} + \frac{1}{a-k} \right)$$

kelib chiqadi. ►

**20.7-misol.** Quyidagi

$$f(x) = \begin{cases} -x, & \text{agar } -\pi \leq x \leq 0 \\ 0, & \text{agar } 0 < x < \pi \end{cases} \text{ bo'lsa,}$$

funksiya Furye qatoriga yoyilsin.

◀ Bu funksiya yuqoridaq 2-teorema shartini qanoatlantirishini ko'rish qiyin emas.

Berilgan funksiyaning Furye koeffitsientlarini topib, Furye qatorini yozamiz:

$$a_0 = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) dx = \frac{1}{\pi} \left[ \frac{x^2}{2} \right]_{-\pi}^{\pi} = \frac{\pi^2}{2}.$$

$$a_k = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \cos kx dx = -\frac{1}{\pi} \int_{-\pi}^0 x \cos kx dx = -\frac{1}{k\pi} x \sin kx \Big|_{-\pi}^0 +$$

$$+ \frac{1}{k\pi} \int_{-\pi}^0 \sin kx dx = \frac{1}{k\pi} (\cos k\pi - \cos 0) = \frac{1}{k\pi} ((-1)^k - 1)$$

Demak,

$$a_k = \begin{cases} \frac{2}{k^2\pi}, & \text{agar } k \text{ toq son bo'lsa,} \\ 0, & \text{agar } k \text{ juft son bo'lsa.} \end{cases}$$

Endi  $a_k$  koeffitsientlarini hisoblaymiz:

$$a_k = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \sin kx dx = -\frac{1}{\pi} \int_{-\pi}^0 x \sin kx dx = \frac{1}{\pi} x \frac{\cos kx}{k} \Big|_{-\pi}^0 =$$

$$-\frac{1}{\pi} \int_{-\pi}^0 \frac{\cos kx}{k} dx = \frac{\cos k\pi}{k} = \frac{(-1)^k}{k}$$

Shunday qilib,  $x \in (-\pi, \pi)$  uchun

$$T(f, x) = \frac{\pi}{4} - \frac{2}{\pi} \sum_{k=1}^{\infty} \frac{\cos(2k-1)x}{(2k-1)^2} + \sum_{k=1}^{\infty} (-1)^k \frac{\sin kx}{k} = f(x),$$

$x = \pm\pi$  da esa

$$T(f, -\pi) = T(f, \pi) = \frac{0 + \pi}{2} = \frac{\pi}{2}$$

bo'ladi. ▶

### 20.8-misol. Ushbu

$$f(x) = \begin{cases} 1 & \text{agar } -\pi \leq x < 0 \\ -1 & \text{agar } 0 \leq x < \pi \end{cases} \text{ bo'lsa,}$$

funksiya Fureye qatoriga yoyilsin.

◀ Bu funksiya yuqoridagi teoremaning shartlarini qanoatlantiradi. Berilgan funksiyaning Fureye koefitsientlarini hisoblab, uning Fureye qatorini topamiz:

$$a_0 = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) dx = \frac{1}{\pi} \int_{-\pi}^0 dx - \frac{1}{\pi} \int_0^{\pi} dx = 0.$$

$$a_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \cos nx dx = \frac{1}{\pi} \int_{-\pi}^0 \cos nx dx - \frac{1}{\pi} \int_0^{\pi} \cos nx dx = 0 \quad (n = 1, 2, 3, \dots).$$

$$\begin{aligned} a_n &= \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \sin nx dx = \frac{1}{\pi} \int_{-\pi}^0 \sin nx dx - \frac{1}{\pi} \int_0^{\pi} \sin nx dx = \\ &= -\frac{1}{n\pi} (\cos 0 - \cos n\pi) + \frac{1}{n\pi} (\cos n\pi - \cos 0) = -\frac{2}{n\pi} (\cos n\pi - \cos 0) = \frac{2}{n\pi} [(-1)^n - 1] \end{aligned}$$

Demak,

$$a_n = \begin{cases} 0 & \text{agar } n \text{ juft son bo'lsa,} \\ -\frac{4}{n\pi} & \text{agar } n \text{ toq son bo'lsa.} \end{cases}$$

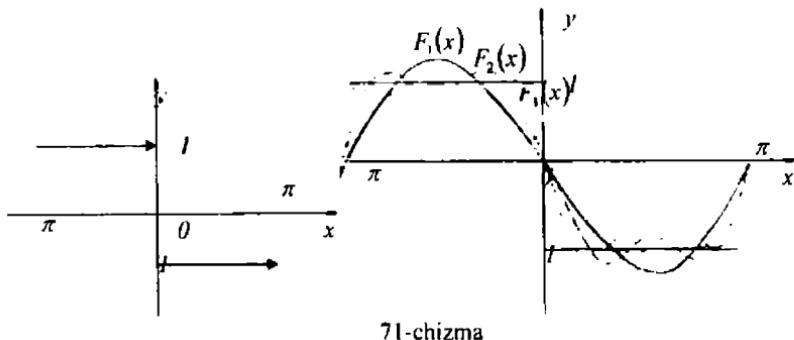

Shunday qilib, berilgan  $f(x)$  funksiyaning Fureye qatori

$$T(f, x) = -\frac{4}{\pi} \sum_{n=1}^{\infty} \frac{\sin(2n-1)x}{2n-1} = -\frac{4}{\pi} \left( \sin x + \frac{\sin 3x}{3} + \frac{\sin 5x}{5} + \dots \right)$$

bo'ladi va uning yig'indisi

$$T(f, x) = \begin{cases} f(x) & \text{agar } x \in (-\pi, \pi) \setminus \{0\}, \\ \frac{f(-0) + f(0)}{2} = \frac{1 + (-1)}{2} = 0 & \text{agar } x = 0 \\ \frac{f(-\pi - 0) + f(-\pi + 0)}{2} = 0 & \text{agar } x = -\pi \\ \frac{f(\pi - 0) + f(\pi + 0)}{2} = 0 & \text{agar } x = \pi \end{cases}$$

bo'ladi. 71-chizmada  $f(x)$  funksiyaning va uning Fureye qatorining va qismiy yig'indilari tasvirlangan.

71-chizma

### 5-§. Qismiy yig'indilarining bir ekstremal xossasi Bessel tengsizligi

$f(x)$  funksiya  $[a, b]$  oraliqda berilgan. Bu funksiya va uning kvadrati ham shu oraliqda integrallanuvchi bo'lsin. Odatda bunday funksiyalar kvadrati bilan integrallanuvchi deb ataladi.

Agar  $f(x)$  funksiya  $[a, b]$  da kvadrati bilan integrallanuvchi bo'lsa, u shu oraliqda absolyut integrallanuvchi bo'ladi. Haqiqatdan ham, ushbu

$$|f(x)| \leq \frac{1}{2} (1 + f^2(x))$$

tengsizlikdan foydalaniib

$$\int_a^b |f(x)| dx$$

ning mavjud bo'lishini topamiz. Bu esa  $f(x)$  funksiyaning  $[a, b]$  da absolyut integrallanuvchi ekanini bildiradi.

Ammo  $f(x)$  funksiyaning absolyut integrallanuvchi bo'lishidan, uning kvadrati bilan integrallanuvchi bo'lishi har doim kelib chiqavermaydi.

Masalan, ushbu

$$f(x) = \frac{1}{\sqrt{x}}$$

funksiya  $(0, 1]$  da integrallanuvchi, lekin

$$f^2(x) = \frac{1}{x}$$

funksiya esa  $(0, 1]$  da integrallanuvchi emas (qaralsin, 16-bob, 5-§).

Demak, kvadrati bilan integrallanuvchi funksiyalar to'plami, absolyut integrallanuvchi funksiyalar to'plamining qismi bo'ladi.

$f(x)$  funksiya  $[-\pi, \pi]$  da kvadrati bilan integrallanuvchi funksiya,  $T_n(x)$  darajasi  $n$  dan katta bo'limgan trigonometrik ko'phad bo'lsin:

$$T_n(x) = \frac{a_0}{2} + \sum_{k=1}^n (a_k \cos kx + b_k \sin kx).$$

Ravshanki, bunday ko'phadlar ham  $[-\pi, \pi]$  da kvadrati bilan integrallanuvchi bo'ladir. Koshi-Bunyakovskiy tengsizligidan

$$\int_{-\pi}^{\pi} [f(x) - T_n(x)]^2 dx \quad (20.31)$$

integralning ham mavjudligi kelib chiqadi. Bu integral muayyan  $f(x)$  da

$$a_0, a_1, \beta_1, \alpha_2, \beta_2, \dots, a_n, \beta_n, \dots$$

larga bog'liq:

$$J = J(a_0, a_1, \beta_1, \alpha_2, \beta_2, \dots, a_n, \beta_n, \dots) = \int_{-\pi}^{\pi} [f(x) - T_n(x)]^2 dx.$$

Endi quyidagi masalani qaraylik. Shu koeffsientlar qanday tanlab elingandan  $J$  eng kichik qiymatga ega bo'ladi? Bu masalani hal etish uchun yuqoridaq (20.31) integralni hisoblaylik:

$$\int_{-\pi}^{\pi} [f(x) - T_n(x)]^2 dx = \int_{-\pi}^{\pi} f^2(x) dx - 2 \int_{-\pi}^{\pi} f(x) T_n(x) dx + \int_{-\pi}^{\pi} T_n^2(x) dx \quad (20.32)$$

$f(x)$  funksiya Fureye koeffsientlari uchun

$$a_0 = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) dx,$$

$$a_k = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \cos kx dx \quad (k = 1, 2, \dots)$$

$$\beta_k = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \sin kx dx \quad (k = 1, 2, \dots)$$

formulalardan foydalansak,

$$\begin{aligned} \int_{-\pi}^{\pi} f(x) T_n(x) dx &= \int_{-\pi}^{\pi} f(x) \left[ \frac{a_0}{2} + \sum_{k=1}^n (a_k \cos kx + \beta_k \sin kx) \right] dx = \frac{a_0}{2} a_0 \pi + \\ &+ \sum_{k=1}^n (a_k a_k \pi + \beta_k b_k \pi) = \pi \left[ \frac{a_0^2}{2} + \sum_{k=1}^n (a_k^2 + \beta_k^2) \right] \end{aligned} \quad (20.33)$$

bo'ladi.

Agar

$$\int_{-\pi}^{\pi} \cos kx dx = \int_{-\pi}^{\pi} \sin x dx = 0, \quad \int_{-\pi}^{\pi} \cos kx \sin kx dx = 0$$

$$\int_{-\pi}^{\pi} \sin^2 kx dx = \int_{-\pi}^{\pi} \cos^2 kx dx = \pi$$

ekanini e'tiborga olsak, u holda

$$\int_{-\pi}^{\pi} T_n^2(x) dx = \int_{-\pi}^{\pi} \left[ \frac{a_0}{2} + \sum_{k=1}^n (a_k \cos kx + \beta_k \sin kx) \right]^2 dx = \pi \left[ \frac{a_0^2}{2} + \sum_{k=1}^n (a_k^2 + \beta_k^2) \right] \quad (20.34)$$

bo'ladi. Yuqoridaq (20.32), (20.33), (20.34) tengliklardan foydalanib quyidagini topamiz:

$$\int_{-\pi}^{\pi} [f(x) - T_n(x)]^2 dx = \int_{-\pi}^{\pi} f^2(x) dx - 2\pi \left[ \frac{a_0 a_0}{2} + \sum_{k=1}^n a_k a_k + \sum_{k=1}^n b_k b_k \right] -$$

$$- \pi \left[ \frac{a_0^2}{2} + \sum_{k=1}^n a_k^2 + \sum_{k=1}^n b_k^2 \right] = \int_{-\pi}^{\pi} f^2(x) dx - \pi \left[ \frac{a_0^2}{2} + \sum_{k=1}^n a_k^2 + \sum_{k=1}^n b_k^2 \right] +$$

$$+ \pi \left[ \frac{(a_0 - a_0)^2}{2} + \sum_{k=1}^n (a_k - a_k)^2 + \sum_{k=1}^n (b_k - b_k)^2 \right]$$

Bu tenglikdan ko'rinadiki,

$$\int_{-\pi}^{\pi} [f(x) - T_n(x)]^2 dx$$

integral

$$a_0 = a_0.$$

$$a_k = a_k, \quad (k = 1, 2, 3, \dots, n)$$

$$b_k = b_k$$

bo'lqandagina o'zining eng kichik qiymatiga erishadi va u qiyamat

$$\int_{-\pi}^{\pi} f^2(x) dx - \pi \left[ \frac{a_0^2}{2} + \sum_{k=1}^n a_k^2 + \sum_{k=1}^n b_k^2 \right]$$

bo'ladi, ya'ni:

$$\min_{a_0, a_1, a_2, \dots, a_n, b_n} \int_{-\pi}^{\pi} [f(x) - T_n(x)]^2 dx = \int_{-\pi}^{\pi} f^2(x) dx - \pi \left[ \frac{a_0^2}{2} + \sum_{k=1}^n a_k^2 + \sum_{k=1}^n b_k^2 \right].$$

Shunday qilib quyidagi teoremani isbotladik.

**3-teorema.**  $f(x)$  funksiya  $[-\pi, \pi]$  da kvadrati bilan integrallanuvchi bo'lsin. Darajasi  $n$  dan katta bo'lмаган барча trigonometrik ко'phadlar  $\{T_n(x)\}$  ichida ushbu

$$\int_{-\pi}^{\pi} [f(x) - T_n(x)]^2 dx$$

integralga eng kichik qiymat beruvchi ko'phad  $f(x)$  funksiya Fureye qatorining  $n$ -qismiy yig'indisi bo'ladi:

$$\begin{aligned} \min_{T_n(x)} \int_{-\pi}^{\pi} [f(x) - T_n(x)]^2 dx &= \int_{-\pi}^{\pi} [f(x) - F_n(f; x)]^2 dx = \\ &= \int_{-\pi}^{\pi} f^2(x) dx - \pi \left[ \frac{a_0^2}{2} + \sum_{k=1}^n a_k^2 + \sum_{k=1}^n b_k^2 \right] \end{aligned} \tag{20.35}$$

**3-natija.** Agar  $f(x)$  funksiya  $[-\pi, \pi]$  da kvadrati bilan integrallanuvchi bo'lsa, u holda bu funksiyaning Fureye koeffsientlari kvadratlaridan tuzilgan:

$$\sum_{k=1}^{\infty} a_k^2, \quad \sum_{k=1}^{\infty} b_k^2$$

qatorlar yaqinlashuvchi bo'ladi va quyidagi tengsizlik o'rinnlidir:

$$\frac{a_0^2}{2} + \sum_{k=1}^n a_k^2 + \sum_{k=1}^n b_k^2 \leq \frac{1}{\pi} \int_{-\pi}^{\pi} f^2(x) dx \tag{20.36}$$

◀ (20.35) munosabatdan

$$\int_{-\pi}^{\pi} f^2(x) dx = \pi \left| \frac{a_0^2}{2} + \sum_{k=1}^{\infty} a_k^2 + \sum_{k=1}^{\infty} b_k^2 \right| \geq 0$$

ya'ni,  $\forall n$  uchun

$$\frac{a_0^2}{2} + \sum_{k=1}^{\infty} a_k^2 + \sum_{k=1}^{\infty} b_k^2 \leq \frac{1}{\pi} \int_{-\pi}^{\pi} f^2(x) dx$$

bo'ladi. Bu erda  $n$  ni cheksizlikka intiltirib, keltirilgan natijani va tengsizlikni hosil qilamiz.

(20.36) tengsizlik Bessel tengsizligi deb ataladi.

### 6-§. Yaqinlashuvchi Furye qatori yig'indisining funksional xossalar

Biz mazkur kursning 14-bobida yaqinlashuvchi funksional qatorlar yig'indisining funksional xossalarini batafsil o'rgandik. Ravshanki, berilgan funksiyaning Furye qatori funksional qatorlarning hususiy holidir. Binobarin, tegishli shartlarda Furye qatorlari yig'indilari ham 14-bobda keltirilgan xossalarga ega bo'ladi. Quyida ulami isbotsiz keltiramiz.

$f(x)$  funksiya  $[-\pi, \pi]$  da berilgan va uning Furye qotori

$$T(f, x) = \frac{a_0}{2} + \sum_{n=1}^{\infty} (a_n \cos nx + b_n \sin nx) \quad (20.37)$$

$[-\pi, \pi]$  da yaqinlashuvchi bo'ladi.

1<sup>o</sup>. Furye qatorlari yig'indisining uzluksizligi. Agar (20.37) qator  $[-\pi, \pi]$  da tekis yaqinlashuvchi bolsa, u holda bu qatomning  $T(f, x)$  yig'indisi  $[-\pi, \pi]$  oraliqda uzluksiz funksiya bo'ladi.

2<sup>o</sup>. Furye qatorini hadma-had integrallash. Agar (20.37) qator  $[-\pi, \pi]$  da kis yaqinlashuvchi bolsa, u holda (20.37) qator hadlarining integrallaridan izilgan.

$$\begin{aligned} & \int_a^b \frac{a_0}{2} dx + \sum_{n=1}^{\infty} \left( a_n \int_a^b \cos nx dx + b_n \int_a^b \sin nx dx \right) = \\ & = \frac{a_0}{2} (b - a) + \sum_{n=1}^{\infty} \left( a_n \frac{\sin nb - \sin na}{n} + b_n \frac{\cos na - \cos nb}{n} \right) \end{aligned}$$

qator  $(-\pi < a < b \leq \pi)$  ham yaqinlashuvchi bo'ladi va uning yig'indi

$$\int_a^b T(f, x) dx$$

ga teng bo'ladi, ya'ni

$$\begin{aligned} & \int_a^b T(f, x) dx = \int_a^b \left| \frac{a_0}{2} + \sum_{n=1}^{\infty} (a_n \cos nx + b_n \sin nx) \right| dx = \\ & = \int_a^b \frac{a_0}{2} dx + \sum_{n=1}^{\infty} \left| \int_a^b (a_n \cos nx + b_n \sin nx) dx \right| \end{aligned}$$

**3<sup>o</sup>. Furye qatorini hadma-had differensiallash.** Agar (20.37) qator har bir hadining hosilalaridan tuzilgan

$$\sum_{n=1}^{\infty} (-na_n \sin nx + nb_n \cos nx)$$

qator  $[-\pi, +\pi]$  da tekis yaqinlashuvchi bo'lsa. u holda berilgan Furye qatorining yig'indisi  $T(f; x)$  shu  $[-\pi, +\pi]$  da  $T'(f; x)$  hosilaga ega va

$$T'(f; x) = \sum_{n=1}^{\infty} (-na_n \sin nx + nb_n \cos nx)$$

bo'ladi.

Shunday qilib, umumiy holdagidek  $f(x)$  funksiya Furye qatori yig'indisining funksional xossalari o'rganishda Furye qatorining tekis yaqinlashuvchi bo'lishi muhim ro'l o'yinayapti. Binobarin, Furye qatorining tekis yaqinlashuvchi bo'lishini ta'minlaydigan shartlarini aniqlash lozim bo'ladi.

**4-teorema. Furye qatorining tekis yaqinlashishi.**  $f(x)$  funksiya  $[-\pi, +\pi]$  oraliqda berilgan, uzuksiz hamda  $f(-\pi) = f(\pi)$  bo'lsin. Agar bu funksiya  $[-\pi, +\pi]$  oraliqda bo'lakli - silliq bo'lsa, u holda  $f(x)$  funksiyaning Furye qatori

$$T(f; x) = \frac{a_0}{2} + \sum_{n=1}^{\infty} (a_n \cos nx + b_n \sin nx)$$

$[-\pi, +\pi]$  oraliqda tekis yaqinlashuvchi bo'ladi.

◀ Berilgan  $f(x)$  funksiya Furye qatorining har bir

$$u_n(x) = a_n \cos nx + b_n \sin nx \quad (n = 1, 2, 3, \dots)$$

hadi uchun

$$|u_n(x)| = |a_n \cos nx + b_n \sin nx| \leq |a_n| + |b_n| \quad (n = 1, 2, 3, \dots)$$

bo'ladi.

Endi

$$\frac{a_0}{2} + \sum_{n=1}^{\infty} (|a_n| + |b_n|)$$

qatorning yaqinlashuvchi bo'lishini ko'rsatamiz.

Furye koeffitsientlari

$$a_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \cos nx dx, \quad b_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \sin nx dx$$

ni qaraylik.

Bo'laklab integrallash qoidasiga ko'ra

$$\begin{aligned} a_n &= \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) d\left(\frac{\sin nx}{n}\right) = \frac{1}{\pi} f(x) \cdot \frac{1}{n} \sin nx \Big|_{-\pi}^{\pi} - \\ &\quad - \frac{1}{n\pi} \int_{-\pi}^{\pi} f'(x) \sin nx dx = -\frac{1}{n} \cdot \frac{1}{\pi} \int_{-\pi}^{\pi} f'(x) \sin nx dx, \end{aligned} \tag{20.38}$$

$$a_n = -\frac{1}{\pi} \int_{-\pi}^{\pi} f(x) dx \left( \frac{\cos nx}{n} \right) = -\frac{1}{\pi} f(x) \frac{1}{n} \cos nx \Big|_{-\pi}^{\pi} + \frac{1}{n\pi} \int_{-\pi}^{\pi} f'(x) \cos nx dx = -\frac{1}{n\pi} (-1)^n [f(\pi) - f(-\pi)] + \frac{1}{n\pi} \int_{-\pi}^{\pi} f'(x) \cos nx dx$$

Agar  $f(-\pi) = f(\pi)$  shartni e'tiborga olsak, u holda

$$a_n = \frac{1}{n} \cdot \frac{1}{\pi} \int_{-\pi}^{\pi} f'(x) \cos nx dx \quad (20.39)$$

bo'ladi.

$f'(x)$  ning Furey koefitsientlarini  $a'_n$  va  $\sigma'_n$  desak:

$$a'_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f'(x) \cos nx dx, \quad \sigma'_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f'(x) \sin nx dx,$$

u holda (20.38) va (20.39) munosabatlarga ko'ra

$$a_n = -\frac{1}{n} \sigma'_n, \quad \sigma_n = -\frac{1}{n} a'_n \quad (n = 1, 2, 3, \dots)$$

bo'ladi. Natijada

$$|a_n| + |\sigma_n| = \frac{1}{n} (|a'_n| + |\sigma'_n|)$$

bo'ladi.

Agar

$$\frac{1}{n} (|a'_n| + |\sigma'_n|) = \frac{1}{n} |a'_n| + \frac{1}{n} |\sigma'_n| \leq \frac{1}{2} \left( a'^{2}_n + \frac{1}{n^2} \right) + \frac{1}{2} \left( \sigma'^{2}_n + \frac{1}{n^2} \right) = \frac{1}{2} \left( a'^{2}_n + \sigma'^{2}_n \right) + \frac{1}{n^2}$$

bo'lishini hisobga olsak, unda ushbu

$$|a_n| + |\sigma_n| \leq \frac{1}{2} (a'^{2}_n + \sigma'^{2}_n) + \frac{1}{n^2} \quad (20.40)$$

tengsizlikka ega bo'lamiz.

Shartga ko'ra  $f(x)$  funksiya bo'lakli-uzluksizdir. Binobarin, u kvadrati bilan integrallanuvchidir. Shuning uchun bu funksiyaning  $a'_n, \sigma'_n$  Furey koefitsientlari Bessel tengsizligini qanoatlanadiradi, ya'ni

$$\frac{a'_n}{2} + \sum_{n=1}^{\infty} (a'^{2}_n + \sigma'^{2}_n) \leq \frac{1}{\pi} \int_{-\pi}^{\pi} f'^{2}(x) dx$$

bo'ladi. Demak,

$$\frac{a'_n}{2} + \sum_{n=1}^{\infty} (a'^{2}_n + \sigma'^{2}_n)$$

qator yaqinlashuvchi. Unda yaqinlashuvchi qatorlarning xossalalariga ko'ra ushbu

$$\sum_{n=1}^{\infty} \left[ \frac{1}{2} (a'^{2}_n + \sigma'^{2}_n) + \frac{1}{n^2} \right] \quad (20.41)$$

qator ham yaqinlashuvchi bo'ladi.

Yuqorida keltirilgan (20.40) tengsizlikka muvofiq

$$\sum_{n=1}^{\infty} (|a_n| + |b_n|)$$

qatorning har bir hadi (20.41) qatorning mos hadidan katta emas.

Taqqoslash teoremasiga ko'ra (qaralsin. I-tom. 2-hob, 8-§) (20.39) qator yaqinlashuvchi, demak.

$$\frac{|a_0|}{2} + \sum_{n=1}^{\infty} (|a_n| + |b_n|)$$

qator yaqinlashuvchi bo'ladi.

Veyersharris alomatidan (14-hob, 2-§) foydalanim, Furye qatorining  $[-\pi, +\pi]$  da tekis yaqinlashuvchi bo'lishini topamiz. ▶

### 7-§. Funksiyalarni trigonometrik ko'phad bilan vaqinlashirish

**Feyer yig'indisi.**  $f(x)$  funksiya  $[-\pi, +\pi]$  oraliqda berilgan va uzlusiz bo'lsin. Bu funksiya Furye qatorining qismiy yig'indisi

$$F_n(f, x) = \frac{a_0}{2} + \sum_{k=1}^n (a_k \cos kx + b_k \sin kx)$$

dan foydalanim, ushbu

$$\sigma_n(f, x) = \frac{1}{n} [F_0(f; x) + F_1(f; x) + \dots + F_{n-1}(f; x)], \quad F_0(f, x) = \frac{a_0}{2} \quad (20.42)$$

yig'indini tuzamiz. Odatda (20.42) yig'indi  $f(x)$  funksiyaning Feyer yig'indisi deb ataladi.

$f(x)$  funksiyaning Feyer yig'indisi  $\sigma_n(f; x)$  trigonometrik ko'phad bo'ladi. Haqiqatdan ham, Furye qatori qismiy yig'indilarining ifodalari

$$F_0(f; x) = \frac{a_0}{2},$$

$$F_1(f; x) = \frac{a_0}{2} + a_1 \cos x + b_1 \sin x,$$

$$F_2(f; x) = \frac{a_0}{2} + a_1 \cos x + b_1 \sin x + a_2 \cos 2x + b_2 \sin 2x,$$

$$F_{n-1}(f; x) = \frac{a_0}{2} + a_1 \cos x + b_1 \sin x + \dots + a_{n-1} \cos(n-1)x + b_{n-1} \sin(n-1)x$$

ga ko'ra

$$\sigma_1(f, x) = \frac{a_0}{2},$$

$$\sigma_2(f, x) = \frac{a_0}{2} + \frac{1}{2} a_1 \cos x + \frac{1}{2} b_1 \sin x,$$

$$\sigma_3(f, x) = \frac{a_0}{2} + \frac{2}{3} a_1 \cos x + \frac{2}{3} b_1 \sin x + \frac{1}{3} a_2 \cos 2x + \frac{1}{3} b_2 \sin 2x,$$

$$\sigma_n(f, x) = \frac{a_0}{2} + \frac{n-1}{n} a_1 \cos x + \frac{n-1}{n} a_1 \sin x + \dots + \frac{1}{n} a_n \cdot \cos(n-1)x + \\ + \frac{1}{n} a_{n-1} \sin(n-1)x = \frac{a_0}{2} + \sum_{k=1}^{n-1} \left( \frac{n-k}{n} a_k \cos kx + \frac{n-k}{n} a_k \sin kx \right)$$

bo'ldi.

Agar 3-§ da keltirilgan ushbu tenglik

$$F_n(l; x) = l \quad (n = 1, 2, 3, \dots)$$

ni e'tiborga olsak, unda (20.42) dan

$$\sigma_n(l; x) = l \quad (20.43)$$

bo'lishi kelib chiqadi.

(20.42) munosabatdagi  $F_k(f, x)$  ( $k = 0, 1, 2, \dots, n-1$ ) ning o'miga uning ifodasi

$$F_k(f, x) = \frac{1}{\pi} \int_0^\pi [f(x+u) + f(x-u)] \frac{\sin \frac{2k+1}{2}u}{2 \sin \frac{u}{2}} du$$

ni qo'yib quyidagini topamiz:

$$\sigma_n(f, x) = \frac{1}{n\pi} \sum_{k=0}^{n-1} \left\{ \int_0^\pi [f(x+u) + f(x-u)] \frac{\sin \frac{2k+1}{2}u}{2 \sin \frac{u}{2}} du \right\} = \\ = \frac{1}{2n\pi} \int_0^\pi \frac{f(x+u) + f(x-u)}{\sin \frac{u}{2}} \sum_{k=0}^{n-1} \sin(2k+1) \frac{u}{2} du = \\ = \frac{1}{n\pi} \int_0^\pi \frac{f(x+2t) + f(x-2t)}{\sin t} \sum_{k=0}^{n-1} \sin(2k+1)t dt.$$

Integral ostidagi yig'indi uchun

$$\sum_{k=0}^{n-1} \sin(2k+1)t = \frac{\sin^2 nt}{\sin t}$$

munosabat o'rinali. Haqiqatdan ham,

$$\sin t \sum_{k=0}^{n-1} \sin(2k+1)t = \sum_{k=0}^{n-1} \sin t \cdot \sin(2k+1)t = \\ = \sum_{k=0}^{n-1} \frac{1}{2} [\cos 2kt - \cos(2k+2)t] = \frac{1}{2} (1 - \cos 2nt) = \sin^2 nt.$$

Natijada  $f(x)$  funksiyaning Feyer yig'indisi ushbu

$$\sigma_n(f, x) = \frac{1}{n\pi} \int_0^\pi [f(x+2t) + f(x-2t)] \left( \frac{\sin nt}{\sin t} \right)^2 dt \quad (20.44)$$

ko'rinishni oladi. Bu va yuqoridaagi (20.43) tenglikdan

$$1 = \frac{1}{n\pi} \int_0^{\frac{\pi}{2}} 2 \left( \frac{\sin nt}{\sin t} \right)^2 dt \quad (20.45)$$

bo'lishi kelib chiqadi.

**5-teorema (Feyer teoremasi).**  $f(x)$  funksiya  $[-\pi, +\pi]$  oraliqda berilgan, uzlksiz va  $f(-\pi) = f(\pi)$  bo'lsin. U holda

$$\lim_{n \rightarrow \infty} \sup_{-\pi \leq x \leq \pi} |\sigma_n(f, x) - f(x)| = 0$$

bo'ladi.

◀ (20.45) tenglikning har ikki tomonini  $f(x)$  ga ko'paytirsak, u holda

$$f(x) = \frac{1}{n\pi} \int_0^{\frac{\pi}{2}} 2f(x) \left( \frac{\sin nt}{\sin t} \right)^2 dt$$

bo'ladi. Bu va (20.44) munosabatdan foydalanib, ushbuni topamiz:

$$\sigma_n(f, x) - f(x) = \frac{1}{n\pi} \int_0^{\frac{\pi}{2}} [f(x+2t) + f(x-2t) - 2f(x)] \left( \frac{\sin nt}{\sin t} \right)^2 dt. \quad (20.46)$$

Modomiki, shartga ko'ra  $f(x)$  funksiya  $[-\pi, +\pi]$  da uzlksiz ekan, u Kantor teoremasiga binoan tekis uzlksiz bo'ladi. Demak,  $\forall \varepsilon > 0$  olinganda ham, shunday  $\delta = \delta(\varepsilon) > 0$  topiladiki,  $|x' - x| < 2\delta$  tengsizlikni qanoatlantiruvchi  $\forall x', x'' \in [-\pi, +\pi]$  uchun

$$|f(x') - f(x'')| < \frac{\varepsilon}{2} \quad (20.47)$$

bo'ladi. Shu topilgan  $\delta$  sonni olib (uni  $\delta < \frac{\pi}{2}$  deb hisoblash mumkin), (20.46)

integralni ikki qismga ajratamiz:

$$\sigma_n(f, x) - f(x) = J_1(n, \delta) + J_2(n, \delta)$$

bunda

$$J_1(n, \delta) = \frac{1}{n\pi} \int_0^{\frac{\pi}{2}} [f(x+2t) + f(x-2t) - 2f(x)] \left( \frac{\sin nt}{\sin t} \right)^2 dt,$$

$$J_2(n, \delta) = \frac{1}{n\pi} \int_{\delta}^{\frac{\pi}{2}} [f(x+2t) + f(x-2t) - 2f(x)] \left( \frac{\sin nt}{\sin t} \right)^2 dt.$$

Endi  $J_1(n, \delta)$  va  $J_2(n, \delta)$  integrallarni baholaymiz. Yuqoridaagi (20.47) munosabatni e'tiborga olib quyidagini topamiz:

$$\begin{aligned} |J_1(n, \delta)| &\leq \frac{1}{n\pi} \int_0^{\delta} [|f(x+2t) - f(x)| + |f(x-2t) - f(x)|] \left( \frac{\sin nt}{\sin t} \right)^2 dt < \\ &< \frac{1}{n\pi} \int_0^{\delta} \left( \frac{\varepsilon}{2} + \frac{\varepsilon}{2} \left( \frac{\sin nt}{\sin t} \right)^2 \right) dt \leq \frac{\varepsilon}{n\pi} \int_0^{\delta} \left( \frac{\sin nt}{\sin t} \right)^2 dt = \frac{\varepsilon}{2}. \end{aligned}$$

Demak,  $\forall \varepsilon > 0$  olinganda ham, shunday  $\delta > 0$  topiladiki, barcha  $n \in N$  lar uchun  $|J_1(n, \delta)| < \frac{\varepsilon}{2}$  bo'ladi.

Endi  $J_2(n, \delta)$  integralni baholaymiz.

$$|J_1(n, \delta)| \leq \frac{1}{n\pi} \int_{-\pi}^{\pi} |f(x+2t) + f(x+2t) - 2f(x)| \left( \frac{\sin nt}{\sin t} \right)^2 dt \leq \frac{1}{n\pi} \cdot 4M \int_{-\pi}^{\pi} \left( \frac{\sin nt}{\sin t} \right)^2 dt$$

bunda  $M = \max_{-\pi \leq x \leq \pi} |f(x)|$ . Ravshanki,

$$t \in \left[ \delta, \frac{\pi}{2} \right] \quad (\delta > 0) \text{ da } \left( \frac{\sin nt}{\sin t} \right)^2 \leq \frac{1}{\sin^2 \delta}$$

bo'ladi. Natijada  $|J_2(n, \delta)|$  uchun ushbu  $|J_2(n, \delta)| \leq \frac{1}{n\pi} \cdot \frac{4M}{\sin^2 \delta} \cdot \frac{\pi}{2} = \frac{2M}{n \sin^2 \delta}$  bahoga ega bo'lamiz. Agar natural  $n$  sonni  $n > n_0 = \left\lceil \frac{4M}{\varepsilon \sin^2 \delta} \right\rceil$  qilib olinsa (bunda

$[a]$ -a sonini butun qismi), unda  $\frac{2M}{n \cdot \sin^2 \delta} < \frac{\varepsilon}{2}$  va, demak,  $|J_2(n, \delta)| < \frac{\varepsilon}{2}$  bo'ladi.

Shunday qilib,  $\forall \varepsilon > 0$  olinganda ham shunday  $\delta = \delta(\varepsilon) > 0$  topiladi,  $\forall n \in N$  uchun  $|J_1(n, \delta)| < \frac{\varepsilon}{2}$  bo'ladi. Va shu  $\varepsilon > 0$  va  $\delta = \delta(\varepsilon) > 0$  larga ko'tra shunday  $n_0$  topiladi.  $\forall n > n_0$  uchun  $|J_2(n, \delta)| < \frac{\varepsilon}{2}$  bo'ladi.

Bu tasdiqlarni birlashtirsak,  $\forall \varepsilon > 0$  uchun shunday  $n_0 \in N$  topiladi.  $\forall n > n_0$ ,  $\forall x \in [-\pi, \pi]$  uchun  $|\sigma_n(f, x) - f(x)| < \varepsilon$  bo'ladi.

Demak,  $\lim_{n \rightarrow \infty} \sup_{-\pi \leq x \leq \pi} |\sigma_n(f, x) - f(x)| < \varepsilon$ .

Natijada, funksiyani trigonometrik ko'phad bilan yaqinlashtirish haqidagi quyidagi teoremaga kelamiz.

**6-teorema (Veyershtrass teoremasi).** Agar  $f(x)$  funksiya  $[-\pi, +\pi]$  da berilgan, uzlusiz va  $f(-\pi) = f(\pi)$  bo'lsa, u holda shunday  $\Im_n(x)$  trigonometrik ko'phad topiladi,

$$\lim_{n \rightarrow \infty} \sup_{-\pi \leq x \leq \pi} |\Im_n(x) - f(x)| = 0$$

bo'ladi.

### 8-§. O'rtacha yaqinlashish. Fureye qatorining o'rtacha yaqinlashishi

Funksional ketma-ketlik va qatorlarda tekis yaqinlashish tushunchasi bilan bir qatorda, undan umumiyroq o'rtacha yaqinlashish tushunchasi ham kiritiladi.

**1°. O'rtacha yaqinlashish.**  $[a, b]$  oraliqda biror  $\{f_n(x)\}$ :

$$f_1(x), f_2(x), \dots, f_n(x). \quad (20.48)$$

funksional ketma-ketlik va  $f(x)$  funksiya berilgan bo'lib,  $f_n(x)$  ( $n = 1, 2, 3, \dots$ ) hamda  $f(x)$  lar shu oraliqda kvadrati bilan integrallanuvchi bo'lsin.

**2-ta'rif.** Agar

$$\lim_{n \rightarrow \infty} \int [f_n(x) - f(x)]^2 dx = 0$$

bo'lsa, (20.48) funksional ketma-ketlik  $f(x)$  funksiyaga  $[a, b]$  da o'rtacha yaqinlashadi deb aytildi.

Masalan, ushbu  $\{f_n(x)\} = \{x^n\}$ :

$$x, x^2, \dots, x^n, \dots (x \in [0, 1])$$

funksional ketma-ketlik

$$f(x) = \begin{cases} 0, & \text{agar, } x \in [0, 1) \text{ bo'lsa,} \\ 1, & \text{agar, } x = 1 \text{ bo'lsa} \end{cases}$$

funksiyaga  $[0, 1]$  da o'rtacha yaqinlashadi, chunki

$$\int_0^1 [f_n(x) - f(x)]^2 dx = \int_0^1 (x^n - 0)^2 dx = \int_0^1 x^{2n} dx = \frac{1}{2n+1}$$

va demak,

$$\lim_{n \rightarrow \infty} \int_0^1 (x^n - 0)^2 dx = 0$$

**7-teorema.** Agar (20.48) funksional ketma-ketlik  $f(x)$  ga  $[a, b]$  da tekis yaqinlashsa, shu (20.48) ketma-ketlik  $f(x)$  ga  $[a, b]$  da o'rtacha yaqinlashadi.

► (20.48) ketma-ketlik  $f(x)$  tekis yaqinlashsin.

Ta'rifga binoan.  $\forall \varepsilon > 0$  olinganda ham shunday  $n_0 \in N$  topiladiki,  $\forall n > n_0$  va  $\forall x \in [a, b]$  uchun bir yo'la

$$|f_n(x) - f(x)| < \sqrt{\frac{\varepsilon}{b-a}}$$

bo'ladi. Demak,  $\forall n > n_0$  uchun

$$\left| \int_a^b [f_n(x) - f(x)]^2 dx \right| \leq \int_a^b [f_n(x) - f(x)]^2 dx < \int_a^b \frac{\varepsilon}{b-a} dx = \varepsilon$$

bo'ladi. Bu esa

$$\lim_{n \rightarrow \infty} \int_a^b [f_n(x) - f(x)]^2 dx = 0$$

ekanini bildiradi. Demak,  $\{f_n(x)\}$  ketma-ketlik  $f(x)$  funksiyaga  $[a, b]$  da o'rtacha yaqinlashadi. ►

**2-eslatma.** Funksional ketma-ketlikning  $[a, b]$  da o'rtacha yaqinlashishidan, uning shu oraliqda tekis yaqinlashishi har doim kelib chiqavermaydi. Masalan, yuqorida ko'rdikki  $\{f_n(x)\} = \{x^n\}$  ketma-ketlik

$$f(x) = \begin{cases} 0, & \text{agar, } x \in [0, 1) \text{ bo'lsa,} \\ 1, & \text{agar, } x = 1 \text{ bo'lsa} \end{cases}$$

funksiyaga  $[0, 1]$  da o'rtacha yaqinlashadi. Biroq bu funksional ketma-ketlik shu  $f(x)$  funksiyaga  $[0, 1]$  da tekis yaqinlashmaydi (qaralsin, 14-boh, 2-§).

Yuqorida keltirilgan teorema va eslatma funksional ketma-ketliklarda o'rtacha yaqinlashish tekis yaqinlashish tushunchasiga qaraganda kengroq tushuncha ekanini ko'rsatadi.

Funksional qatorlarda ham o'rtacha yaqinlashish tushunchasi shunga o'xshash kiritiladi.

$[a, b]$  oraliqda

$$\sum_{k=1}^n u_k(x) = u_0(x) + u_1(x) + \dots + u_n(x) + \dots \quad (20.49)$$

funksional qator berilgan bo'lsin. Bu qator qismiy yig'indilari

$$S_n(x) = \sum_{k=1}^n u_k(x) = u_0(x) + u_1(x) + \dots + u_n(x)$$

dan iborat  $\{S_n(x)\}$  funksional ketma-ketlikni qaraylik.

**3-ta'rif.** Agar

$$\lim_{n \rightarrow \infty} \int [S_n(x) - S(x)]^2 dx = 0$$

bo'lsa, (20.49) funksional qator  $S(x)$  funksiyaga  $[a, b]$  da o'rtacha yaqinlashadi deb ataladi.

**2<sup>q</sup>. Furye qatorining o'rtacha yaqinlashishi.**  $f(x)$  funksiya  $[-\pi, +\pi]$  da berilgan,  $T(f; x)$  esa uning Furye qatori

$$T(f; x) = \frac{a_0}{2} + \sum_{k=1}^{\infty} (a_k \cos kx + b_k \sin kx)$$

bo'lsin.

**8-teorema.** Agar  $f(x)$  funksiya  $[-\pi, +\pi]$  oraliqda uzlusiz va  $f(-\pi) = f(\pi)$  bo'lsa, uning Furye qatori  $[-\pi, +\pi]$  da  $f(x)$  ga o'rtacha yaqinlashadi.

► Shartga ko'ra  $f(x)$  funksiya  $[-\pi, +\pi]$  da uzlusiz va  $f(-\pi) = f(\pi)$ . U holda ushbu hobning 7-§ ida keltirilgan Veyershtrass teoremasiga asosan,  $\forall \varepsilon > 0$  olinganda ham, shunday trigonometrik ko'phad  $\Im_n(x)$  topiladi,  $\forall x \in [-\pi, +\pi]$  uchun

$$|f(x) - \Im_n(x)| < \sqrt{\frac{\varepsilon}{2\pi}}$$

bo'ladi. Bu tengsizlikdan foydalaniib,

$$\int |f(x) - \Im_n(x)|^2 dx < \frac{\varepsilon}{2\pi} \int dx = \varepsilon \quad (20.50)$$

bo'lishini topamiz.

Ma'lumki,  $f(x)$  funksiya Furye qatorining qismiy yig'indisi  $F_n(f; x)$  uchun

$$\int_{-\pi}^{\pi} |f(x) - F_n(f; x)|^2 dx = \min_{T_n(x)} \int_{-\pi}^{\pi} |f(x) - T_n(x)|^2 dx \quad (20.51)$$

bo'ladi (qaralsin, 5-§). Demak, (20.50) va (20.51) munosabatlarga ko'ra

$$\int [f(x) - F_n(f; x)]^2 dx \leq \int [f(x) - T_n(x)]^2 dx < \varepsilon \quad (\forall x \in [-\pi, \pi])$$

bo'ladi. Bu esa

$$\lim_{n \rightarrow \infty} \int [f(x) - F_n(f; x)]^2 dx = 0$$

ya'ni  $f(x)$  funksiya Furye qatori  $[-\pi, +\pi]$  da o'rtacha yaqinlashishini bildiradi. ▶

Biz o'tgan paragrafdan  $[-\pi, +\pi]$  oraliqda kvadriati bilan integrallanuvchi  $f(x)$  funksiya uchun ushu

$$\int [f(x) - F_n(f; x)]^2 dx = \int f^2(x) dx - \pi \left[ \frac{a_0^2}{2} + \sum_{k=1}^n (a_k^2 + e_k^2) \right]$$

tenglikni keltirib chiqargan edik. Bu tenglikdan ko'rindik, agar

$$\lim_{n \rightarrow \infty} \left\{ \int f^2(x) dx - \pi \left[ \frac{a_0^2}{2} + \sum_{k=1}^n (a_k^2 + e_k^2) \right] \right\} = 0$$

ya'ni

$$\frac{1}{\pi} \int f^2(x) dx = \frac{a_0^2}{2} + \sum_{k=1}^{\infty} (a_k^2 + e_k^2) \quad (20.52)$$

bo'lisa, u holda

$$\lim_{n \rightarrow \infty} \int [f(x) - F_n(f; x)]^2 dx = 0$$

bo'ladi va demak,  $f(x)$  funksiyaning Furye qatori  $[-\pi, +\pi]$  da o'rtacha yaqinlashadi.

Shunday qilib,  $f(x)$  funksiyaning Furye qatorining  $[-\pi, +\pi]$  da o'rtacha yaqinlashishini ko'rsatishi uchun (20.52) tenglikning o'tinli bo'lishini ko'rsatish zarur va yetarli bo'ladi. Odatda (20.52) Parseval tengligi deb ataladi.

### 9-§. Funksiyalarning ortogonal sistemasi.

#### Umumlashgan Furye qatori

I". Funksiyalarning ortogonal sistemasi.  $\varphi(x)$  va  $\psi(x)$  funksiyalar  $[a, b]$  da berilgan va ular shu oraliqda integrallanuvchi bo'lisin.

4-ta 'rif. Agar

$$\int \varphi(x) \psi(x) dx = 0$$

bo'lisa,  $\varphi(x)$  va  $\psi(x)$  funksiyalar  $[a, b]$  da ortogonal deb ataladi.

Masalan,  $\varphi(x) = \sin x$ ,  $\psi(x) = \cos x$  funksiyalar  $[-\pi, +\pi]$  da ortogonal bo'ladi, chunki,

$$\int \varphi(x) \cdot \psi(x) dx = \int \sin x \cos x dx = 0$$

bo'ladi.

$\varphi(x) = x$ ,  $\psi(x) = \frac{3}{2}x^2 - 1$  funksiyalar  $[-1, 1]$  da ortogonal bo'ladi, chunki

$$\int_{-1}^1 \varphi(x) \psi(x) dx = \int_{-1}^1 x \left( \frac{3}{2}x^2 - 1 \right) dx = 0.$$

Endi

$$\varphi_0(x), \varphi_1(x), \dots, \varphi_n(x), \dots \quad (20.52)$$

funksiyalarning har biri  $[a, b]$  da berilgan va shu oraliqda integrallanuvchi bo'lsin. Bu (20.52) funksiyalar sistemasini  $\{\varphi_n(x)\}$  kabi belgilaymiz.

*S-ta'rif.* Agar  $\{\varphi_n(x)\}$  funksiyalar sistemasining istalgan ikkita  $\varphi_k(x)$  va  $\varphi_m(x)$  ( $k \neq m$ ) funksiyalari uchun

$$\int_a^b \varphi_k(x) \varphi_m(x) dx = 0 \quad (k \neq m)$$

bo'lsa,  $\{\varphi_n(x)\}$  funksiyalar sistemasi  $[a, b]$  da ortogonal deb ataladi.

Odatda,  $k = m$  ( $k = 0, 1, 2, \dots$ ) bo'lganda

$$\int_a^b \varphi_k^2(x) dx > 0 \quad (k = 0, 1, 2, \dots)$$

deb qaratadi. Bu integralni  $\lambda_k$  kabi belgilaylik:

$$\lambda_k = \int_a^b \varphi_k^2(x) dx \quad (k = 0, 1, 2, \dots).$$

Agar (20.52) sistema uchun  $\lambda_k = 1$  bo'lsa,  $\{\varphi_n(x)\}$  normal sistema deyiladi.

Agar (20.52) sistema uchun

$$\int_a^b \varphi_k(x) \varphi_m(x) dx = \begin{cases} 0, & \text{agar, } k \neq m \text{ bo'lsa}, \\ 1, & \text{agar, } k = m \text{ bo'lsa} \end{cases}$$

bo'lsa,  $\{\varphi_n(x)\}$  funksiyalar sistemasi ortonormal deb ataladi.

Masalan, 1) ushbu

$$1, \cos x, \sin x, \cos 2x, \sin 2x, \dots, \cos nx, \sin nx, \dots$$

sistema (trigonometrik sistema)  $[-\pi, +\pi]$  da ortogonal bo'ladi, chunki  $k \neq m$  bo'lganda

$$\int_{-\pi}^{\pi} \cos kx \cos mx dx = 0, \quad \int_{-\pi}^{\pi} \sin kx \sin mx dx = 0$$

bo'lib, ixtiyorli  $k, m = 0, 1, 2, \dots$  bo'lganda  $\int_{-\pi}^{\pi} \cos kx \sin mx dx = 0$  bo'ladi.

2) Quyidagi

$$\frac{1}{\sqrt{2\pi}}, \frac{\cos x}{\sqrt{\pi}}, \frac{\sin x}{\sqrt{\pi}}, \frac{\cos nx}{\sqrt{\pi}}, \frac{\sin nx}{\sqrt{\pi}}, \dots$$

funksiyalar sistemasi  $[-\pi, +\pi]$  da ortonormal bo'ladi. Bu sistemaning  $[-\pi, +\pi]$  da ortonormal bo'lishi ravshandir. Uning shu  $[-\pi, +\pi]$  da normal bo'lishi esa

$$\int_{-\pi}^{\pi} \left( \frac{1}{\sqrt{\pi}} \cos kx \right)^2 dx = \int_{-\pi}^{\pi} \left( \frac{1}{\sqrt{\pi}} \sin kx \right)^2 dx = 1 \quad (k = 0, 1, 2, \dots)$$

ba'lishidan kelib chiqadi.

(20.52) sistema berilgan bo'lsin. Uning yordamida tuzilgan ushbu

$$\sum_{n=0}^{\infty} c_n \varphi_n(x) = c_0 \varphi_0(x) + c_1 \varphi_1(x) + \dots + c_n \varphi_n(x) + \dots \quad (20.53)$$

funktional qator  $\{\varphi_n(x)\}$  sistema bo'yicha qator deyiladi,  $c_0, c_1, \dots, c_n, \dots$  o'zgarmas sonlar esa qatorning koeffitsientlari deyiladi.

Xususan,  $\varphi_n(x) = a_n \cos nx + b_n \sin nx$  bo'lganda (20.53) qator trigonometrik qatorga aylanadi.

$f(x)$  funksiya  $[a, b]$  oraliqda berilgan va shu oraliqda integrallanuvchi bo'lsin. Ravshanki,  $f(x) \varphi_n(x)$  ( $n = 0, 1, 2, 3, \dots$ ) funksiya ham  $[a, b]$  da integrallanuvchi bo'ladi. Bu funksiyalarning integrallarini hisoblab, ularni quyidagicha belgilaymiz:

$$\alpha_n = \frac{1}{\lambda_n} \int_a^b f(x) \varphi_n(x) dx. \quad (20.54)$$

Bu sonlardan foydalaniib ushbu

$$\sum_{n=0}^{\infty} \alpha_n \varphi_n(x) = \alpha_0 \varphi_0(x) + \alpha_1 \varphi_1(x) + \dots + \alpha_n \varphi_n(x) + \dots \quad (20.55)$$

qatomi tuzamiz.

6-ta'rif.  $\alpha_0, \alpha_1, \dots, \alpha_n, \dots$  - koeffitsientlari (20.54) formula bilan aniqlangan (20.55) qator  $f(x)$  funksiyaning  $\{\varphi_n(x)\}$  sistema bo'yicha Furye qatori deb ataladi.  $\alpha_0, \alpha_1, \dots, \alpha_n, \dots$  - sonlar esa umumlashgan Furye koeffitsientlari deyiladi.

Odatda,  $f(x)$  funksiya bilan unga mos umumlashgan Furye qatori " $\sim$ " helgi orqali quyidagicha yoziladi:

$$f(x) \sim \sum_{n=0}^{\infty} \alpha_n \varphi_n(x) = \alpha_0 \varphi_0(x) + \alpha_1 \varphi_1(x) + \dots + \alpha_n \varphi_n(x) + \dots$$

### Mashqlar

#### 20.9. Ushbu

$$f(x) = e^{-x} \quad (-\pi < x < \pi)$$

funksiyaning Furye qatori topilsin.

#### 20.10. Ushbu

$$f(x) = |\cos x|$$

funksiyani Furye qatoriga yoyilsin. Yoyilmadan foydalaniib quyidagi

$$\sum_{n=1}^{\infty} (-1)^n \frac{1}{4n^2 - 1}, \quad \sum_{n=1}^{\infty} \quad \frac{1}{4n^2 - 1}$$

qatorlarning yig'indilari topilsin.

#### 20.11. Ushbu

$$f(x) = x - [x] = \{x\}$$

funksiyani Furye qatoriga yoyilsin.

**20.12.**  $f(x) = x$ ,  $\varphi(x) = x^2$  funksiyalarnı  $(0, \pi)$  da kosinuslar bo'yicha yoyilmasidan foydalanib, ushbu

$$\sum_{n=1}^{\infty} \frac{\cos nx}{n^2} = \frac{3x^2 - 6\pi x + 2\pi^2}{12}$$

tenglik isbotlansin.
